

nRF54LM20A and nRF54LM20B Wireless SoCs

nRF54LM20A and nRF54LM20B are part of the nRF54L Series of wireless System on Chips (SoCs). Every device in the series integrates an ultra-low power multiprotocol 2.4 GHz radio with MCU (Microcontroller Unit) functionality featuring a 128 MHz Arm[®] Cortex[®]-M33 processor. The nRF54LM20B variant includes an Axon Neural Processing Unit (NPU) – an edge AI accelerator. nRF54LM20A and nRF54LM20B feature an extended peripheral set including high-speed USB, increased memory size with 2036 KB NVM and 512 KB RAM, and up to 66 GPIO pins.

Nordic Semiconductor's proprietary technologies, such as low-leakage RAM and advanced multiprotocol radio design, enable ultra-low power consumption, reducing battery size or extending battery life.

Designed with versatility in mind, the nRF54L Series SoCs enable a broad range of applications. The multiprotocol 2.4 GHz radio supports *Bluetooth*[®] LE with optional features including Channel Sounding introduced in *Bluetooth*[®] Core 6.0, as well as 802.15.4-2020 for standards such as Thread[®], Matter, and Zigbee[®], and a proprietary 2.4 GHz mode supporting up to 4 Mbps for higher throughput. The devices integrate the peripherals expected in a wireless microcontroller, enabling many products to be implemented with a single chip. An integrated RISC-V coprocessor further reduces the need for external ICs.

nRF54LM20A and nRF54LM20B enable demanding designs for *Bluetooth*[®] LE devices, as well as smart home and industrial applications, which require more memory, advanced features, and high GPIO counts.

The nRF54LM20B Axon NPU provides acceleration in edge AI applications such as health, biometric and activity tracking, voice control and audio classification, and low-fidelity vision.

Key features

- 128 MHz Arm[®] Cortex[®]-M33 processor
- 2036 KB NVM and 512 KB RAM
- Multiprotocol 2.4 GHz radio supporting *Bluetooth*[®] LE, 802.15.4-2020, and 2.4 GHz proprietary modes (up to 4 Mbps)
- Seven serial interfaces (SPI/TWI/UART) including high-speed support
- High-speed USB interface
- Extended set of interfaces, peripherals, and timers including Global RTC available in System OFF, ADC, TDM, PDM, NFC, PWM, and QDEC
- 128 MHz RISC-V coprocessor
- Optional Axon NPU
- Advanced security including TrustZone[®] isolation, tamper detection, and cryptographic engine with side-channel leakage protection
- Ultra-compact CSP and QFN packages

Power consumption highlights

Power mode	Current @ 3.0 V
Active with radio	
<i>Bluetooth</i> [®] LE TX 1 Mbps at 0 dBm	5.0 mA
<i>Bluetooth</i> [®] LE TX 1 Mbps at +4 dBm	7.1 mA
<i>Bluetooth</i> [®] LE TX 1 Mbps at +8 dBm	10.9 mA
<i>Bluetooth</i> [®] LE RX 1 Mbps	3.3 mA
Active with processing	
CPU CoreMark [®] from RRAM with cache	2.6 mA
Axon NPU running DS-CNN KWS	3.0 mA
Sleep	
System ON IDLE with GRTC (XOSC) and 512 KB RAM	4.3 µA
System OFF with GRTC wakeup	1.0 µA
System OFF	0.7 µA

Product variants

Part number	NVM	RAM	Axon NPU
nRF54LM20A	2036 KB	512 KB	No
nRF54LM20B	2036 KB	512 KB	Yes

Feature overview

Radio

- **Bluetooth® LE**
 - LE 2M, LE 1M, LE Coded
 - Channel Sounding
- IEEE 802.15.4-2020 – 250 kbps
 - Enables Matter, Thread®, Zigbee®
- 2.4 GHz proprietary GFSK
 - 4 Mbps, 2 Mbps, 1 Mbps
- Single-ended antenna output (on-chip balun)
- 128-bit AES/ECB/CCM/AAR coprocessor
- Configurable TX power with 1 dBm step size from -10 dBm to maximum

Processor

- 128MHz Arm® Cortex®-M33 CPU
 - FPU, DSP, MPU, TrustZone®
 - Debug – SWD, ETM, ITM, DWT, CTI, TPIU

Memory

- 2036 KB NVM (RRAM)
- 512 KB RAM

Edge AI accelerator

- nRF54LM20B only:
 - Axon NPU (AXONS)

Coprocessor/SoftPeripherals

- 128 MHz RISC-V coprocessor (VPR)
- sQSPI available as SoftPeripheral for VPR; see the software documentation for details

Peripherals

- Seven fully featured serial interfaces with EasyDMA, supporting I²C, SPI controller/peripheral, and UART
 - One HS-SPI up to 32 MHz, six SPI up to 8 MHz (SPIM, SPIS)
 - Six TWI up to 400 kHz and I²C compatible (TWIM, TWIS)
 - One HS-UART up to 4 Mbps, six UART up to 1 Mbps (UARTE)
- SAADC with eight programmable gain channels
 - 14-bit at 62.5 ksps (oversampled)
 - 12-bit at 125 ksps (oversampled)
 - 10-bit at up to 2 Msps
- High-speed USB interface (USBHS)
- Global RTC can run in System OFF mode and implement a shared system timer (GRTC)
- NFC-A listening device (NFCT)
- Pulse density modulation interface (PDM)
- Time division multiplexed sound interface, also configurable as I²S interface (TDM)
- Three pulse width modulation four-channel units with autonomous waveform generation (PWM)
- Two quadrature decoders (QDEC)
- Two individual watchdog timers for secure and non-secure context (WDT)
- Seven 32-bit timers with counter mode (TIMER)
- Temperature sensor (TEMP)
- Comparator and low-power comparator with wake-up from System OFF mode (COMP, LPCOMP)

GPIO

- Up to 66 GPIO pins
- 64 MHz and 8 MHz ports

Power supply and clock

- Single-inductor DC/DC regulator
- Single 32 MHz crystal operation
- Optional 32.768 kHz crystal

Security

- Arm TrustZone, Root of Trust, secure boot, secure storage
- Security components – Cryptographic engine (CRACEN), Key management (KMU)
- Physical protection – Tamper detectors (TAMPC, GLITCHDET), Side-channel protection

Key specifications

- 8 dBm/7 dBm maximum TX power (CSP/QFN)
- -95.5 dBm RX sensitivity for 1 Mbps Bluetooth LE
- -101 dBm RX sensitivity for IEEE 802.15.4
- 503 CoreMark®, 3.93 CoreMark/MHz EEMBC CoreMark executing from non-volatile memory
- 1.7 V to 3.6 V supply and GPIO voltage
- -40°C to +85°C operating temperature

Packages for all variants

- CSP61 (CAAA) with 40 GPIO pins
 - 3.02x2.43 mm with 0.325 mm pitch
- CSP98 (PAAA) with 66 GPIO pins
 - 3.67x3.85 mm with 0.35 mm pitch
- QFN52 (QGAA) with 32 GPIO pins
 - 6x6 mm with 0.4 mm pitch

1 Revision history

Date	Version	Description
May 2026	1.0	First release

2 About this document

This document is organized into chapters that are based on the modules and peripherals available in the IC.

2.1 Document status

The document status reflects the level of maturity of the document.

Document name	Description
Preliminary Datasheet	Applies to document versions up to 1.0. This document contains target specifications for product development.
Datasheet	Applies to document versions 1.0 and higher. This document contains final product specifications. Nordic Semiconductor ASA reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.

Table 1: Defined document names

2.2 Peripheral chapters

The chapters describing peripherals include the following information:

- A description of the peripheral.
- The electrical specification tables, containing performance data which applies for the operating conditions described in [Recommended operating conditions](#) on page 1283.

2.2.1 Peripheral naming conventions

Every peripheral has a unique capitalized name or an abbreviation of its name, such as TIMER, that is used for identification and reference.

This name is used in chapter headings and references, and it will appear in the Arm Cortex Microcontroller Software Interface Standard (CMSIS) hardware abstraction layer to identify the peripheral.

When there is more than one instance of a peripheral in a power domain, a two digit number D_n is added as a suffix to the peripheral name when constructing the peripheral instance name. For example, a peripheral named PERI with instance name "PERID_n" is located in power domain D, and is instance number n in that domain. For a list of power domains, see [Power domains](#) on page 11.

The following are additional examples of peripheral instance names:

- PPIB00 is in the MCU domain (0), and is the first PPIB instance in the MCU domain (0).
- SPIS21 is in the PERI domain (2), and is the second SPIS instance of the PERI domain (1).

The peripheral instance name is also used in the CMSIS to identify the peripheral instance.

The domain digits x are listed in the following table.

Domain digit	Power domain
0	MCU
1	RADIO
2	PERI
3	LP

Table 2: Domain digit overview

2.2.2.1 Peripheral instantiation

The peripherals have a set of security capabilities listed in [Instantiation](#) on page 232.

The following table describes the abbreviations used.

Abbreviation	Description
NS	TrustZone/security attribute is non-secure The peripheral is accessible as a non-secure peripheral
S	TrustZone/security attribute is secure The peripheral is accessible as a secure peripheral
US	TrustZone Map is user selectable The TrustZone/security attribute of the peripheral is configurable
HF	TrustZone Map is Hardware Fixed The TrustZone/security attribute of the peripheral cannot be changed
NA	Not Applicable – Peripheral has no DMA capability
NSA	NoSeparateAttribute – Peripheral with DMA and DMA transfer has the same security attribute as assigned to the peripheral
SA	SeparateAttribute – Peripheral with DMA and DMA transfers can have a different security attribute than the one assigned to the peripheral

Table 3: Instantiation table abbreviations

The Secure mapping column in the peripheral instantiation table defines configuration capabilities for the Arm TrustZone for Armv8-M secure attribute. The DMA security column describes the DMA capabilities of the peripheral.

The instantiation table has the following columns:

- Instance Column – Indicates the peripheral instance name followed by optional TrustZone attribute. A corresponding address is listed in the Base address column indicating the base address for secure and non-secure TrustZone attributes. This optional TrustZone attribute is separated by a colon (:).
- Trustzone Column – This has 3 sub-columns indicating the TrustZone map, TrustZone attribute and DMA capability. The options are as listed in [Instantiation table abbreviations](#) on page 5.

2.3 Register overview table

The register overview table shows a summary of all peripheral registers.

The following table explains the columns of the register overview table.

Field	Description
Register	Name of register
Offset	Offset address from peripheral base address
TZ	Security setting for split-security peripherals, blank for other peripherals
Description	Short summary of intended use

Table 4: Register overview table

2.4 Register tables

Individual registers are described using register tables. These tables are composed of two sections. The first three colored rows describe the position and size of the different fields in the register. The following rows describe the fields in more detail.

2.4.1 Fields and values

The ID row specifies the bits that belong to the different fields in the register. If a field has enumerated values, then every value will be identified with a unique value ID in the Value ID column.

A blank space means that the field is reserved and read as undefined. These fields must be written as 0 to secure forward compatibility. If a register is divided into more than one field, a unique field name is specified for each field in the Field column. The Value ID may be omitted in the single-bit bit fields when values can be substituted with a Boolean type enumerator range, such as true/false, disable(d)/enable(d), on/off, and so on.

Values are usually provided as decimal or hexadecimal. Hexadecimal values have a 0x prefix; decimal values have no prefix.

The Value column can be populated in the following ways:

- Individual enumerated values, for example 1, 3, 9.
- Range of values, for example [0..4], indicating all values from 0 to 4.
- Implicit values. If no values are indicated in the Value column, all bit combinations are supported, or the field's translation and limitations are described in the text instead.

If two or more fields are closely related, the Value ID, Value, and Description may be omitted for all but the first field. Subsequent fields will indicate inheritance with '..'.

A feature marked Deprecated should not be used for new designs.

2.4.2 Permissions

Each register field can have different access permissions enforced by hardware. The access permission for each register field is documented in the Access column in the following ways:

Access	Description	Hardware behavior
R	Read only	Field can only be read. A write will be ignored.
W	Write only	Field can only be written. A read will return an undefined value.
RW	Read/write	Field can be read and written multiple times.
W1	Write once	Field can only be written once per reset. Any subsequent write will be ignored. A read will return an undefined value.
RW1	Read/write once	Field can be read multiple times, but only written once per reset. Any subsequent write will be ignored.
W0C	Write 0 to clear	Field can be read multiple times. A zero clears (set to zero) the corresponding bit in the register. Bits set to one are ignored.
W1C	Write 1 to clear	Field can be read multiple times. A one clears (set to zero) the corresponding bit in the register. Bits set to zero are ignored.
W1S	Write 1 to set	Field can be read multiple times. A one sets the corresponding bit in the register. Bits set to zero are ignored.
RME	Read Modify External	When read, a side effect occurs.

Table 5: Register field permission schemes

2.5 Registers

Register overview

Register	Offset	TZ	Description
DUMMY	0x514		Example of a register controlling a dummy feature

2.5.1 DUMMY

Address offset: 0x514

Example of a register controlling a dummy feature

3 Product overview

The device is an ultra-low power System on Chip (SoC) with advanced security features, a range of peripherals, and a multiprotocol 2.4 GHz transceiver.

It supports Bluetooth Low Energy, IEEE 802.15.4 for Thread and Zigbee protocols, and allows for the implementation of proprietary 2.4 GHz protocols.

The main processing unit is an Arm Cortex-M33 processor running at up to 128 MHz, supported by non-volatile RRAM and RAM memory.

The Arm Cortex-M33 has a full set of digital signal processing (DSP) instructions and a memory protection unit (MPU) for application security. The full-featured, single-precision floating-point unit (FPU) supports all single-precision instructions.

The peripheral set offers a variety of analog and digital functionality, enabling single-chip implementation of a wide range of applications.

Hardware isolation between the secure and non-secure resources, as defined by Arm TrustZone, is implemented in the device. The hardware peripherals can be configured as secure or non-secure.

A key management unit (KMU) provides key storage, that when combined with a cryptographic accelerator (CRACEN), ensures discretion of encryption keys even within the secure world. The cryptographic accelerator has protection against differential power analysis (DPA) attacks.

The device protects against physical security attacks through several security measures. It can detect and report fault injection attacks such as voltage glitching or electromagnetic fault injection. An external active shield I/O interface provides PCB or product level security for the detection of a product's encapsulation being opened, or product tampering.

The non-volatile memory on the device has a boot region that can be made immutable before the CPU starts up. Boot initiated from an immutable source allows subsequent boot steps to be performed by authenticated code.

The debug access port can be enabled or disabled to allow both non-intrusive and intrusive debugging, from secure- or non-secure worlds. The non-volatile memory can be protected against erasing, providing protection from unauthenticated repurposing. Authenticated debug access control, such as facilitating the Arm ADAC architecture, is supported through a hardware mailbox. The mailbox allows on-chip firmware to authenticate the debug host before enabling the device debug interface.

The device has a dedicated RISC-V CPU (VPR), which is a fast, lightweight peripheral processor (FLPR) dedicated for software defined peripherals.

3.1 Block diagram

The block diagram illustrates the overall system.

Figure 1: Block diagram

3.2 Memory and package overview

Memory	Device	
	nRF54LM20A	nRF54M20B
Non-volatile memory (RRAM)	2036 KB	2036 KB
Random access memory (RAM)	512 KB	512 KB
Axon NPU (Neural processing unit)	No	Yes

Table 6: Device memory and feature options

Feature		Package		
		QFN52	CSP61	CSP98
Pins	GPIO pins	32	40	66
	Wakeup-pins	26	34	55
	Analog input pins	8	8	8
Security	Active tamper shield pin pairs (in/out)	3	3	4
Debug	ITM parallel trace	No	No	Yes
Device	Package options			
	nRF54LM20A	Yes	Yes	Yes
	nRF54LM20B	Yes	Yes	Yes

Table 7: Package variants

3.3 Power domains

Multiple power domains ensure low-power operation.

The MCU domain contains an Arm Cortex-M33. The CPU is connected to a debug system that allows debug and ETM trace. The CPU executes program code from RRAM through an instruction cache. Data is stored in single-cycle RAM that is divided into multiple bus subordinates forming a continuous RAM space in the memory map. High-speed peripherals are also found in the MCU domain.

There are three additional domains that have peripherals allocated to them. They are the following:

- Radio domain – Contains the short-range radio and supporting peripherals used by the radio protocol stack. It runs at 32 MHz synchronously with the MCU domain.
- Peripheral domain – Contains most peripherals. It runs at 16 MHz synchronously with the MCU domain.
- Low-power domain – Contains peripherals for ultra-low power modes and can be used to wake the rest of the system, even when the peripheral domain is powered off. It runs at 16 MHz asynchronously to the MCU domain.

Each domain is mapped to one APB bus and can be powered independently. EasyDMA traffic from each domain is aggregated in a local AMBIX interconnect and can access RAM in the MCU domain.

Power domains have their own GPIO ports. GPIO pins can be used by peripherals in the same power domain. For exceptions, see [GPIO — General purpose input/output](#) on page 292 and [pin assignments](#).

3.4 Address format

Addresses in the system memory map follow the address format described in the following tables.

Address bits	Description	Enumeration
[28:0]	Address space	
[31:29]	Address regions	0: Program memory 1: Data memory 2: Peripherals/APB space 7: CPU internal peripherals, like Arm Cortex private peripheral bus (PPB)

Table 8: Address regions format

The program and data memory address format is described in the following table.

Address bits	Description	Enumeration
[23:0]	Address space	
[28:24]	Reserved	Set to zero
[31:29]	Address regions	0: Program memory 1: Data memory

Table 9: Program memory and data memory address format

The peripheral address format is described in the following table.

Address bits	Description	Enumeration
[11:0]	Peripheral address space	
[17:12]	Peripheral subordinate index	Used for configuring the SPU — System protection unit on page 195, as the index n of register SPU.PERIPH[n].PERM .
[20:12]	Interrupt vector number	The index in the interrupt vector table
[23:18]	Peripheral APB bus number	1: APB peripherals in MCU power domain 2: APB peripherals in RADIO power domain 3: APB peripherals in PERI power domain 4: APB peripherals in LP power domain
[27:24]	Reserved	Set to zero
[28]	Security	0: Non-secure 1: Secure
[31:29]	Address regions	2: Peripherals on APB bus

Table 10: Peripheral address format

3.5 Memory

The CPU and peripherals with EasyDMA can access memory through the AMBIX interconnects. The same interconnect is used by the CPU to access peripheral registers. The following figure is a simplified interconnect diagram.

Figure 2: Memory layout

See [Block diagram](#) on page 9, [AMBA interconnect \(AMBIX\)](#) on page 28, and [EasyDMA](#) on page 29 for more information about the AMBIX interconnects and EasyDMA.

RAM and RRAM memory regions are protected with TrustZone security and are secure after reset. Memory regions can be configured to be non-secure by using [MPC — Memory Privilege Controller](#) on page 189.

3.5.1 RAM — Random access memory

The device RAM has sections arranged in one contiguous memory range, accessible from both the CPU and peripherals.

Each RAM sections has separate power control for System ON and System OFF mode. This preserves RAM contents in sleep modes or powers off RAM to save power. The sections are illustrated in [Memory layout](#) on page 13, and the register interface is described in [MEMCONF — Memory configuration](#) on page 46.

At the high end of the RAM address range are two dedicated areas:

- ProtectedRAM is used for secure key storage.
- VPR saved context is used by VPR to store and restore the context of the VPR during hibernation sleep.

For details, see [Memory map](#) on page 14.

3.5.2 NVM — Non-volatile memory

The CPU can read from non-volatile memory (RRAM) an unlimited number of times, but is restricted in how it writes to memory and the number of writes it can perform.

Writing to RRAM is managed by the RRAM controller (RRAMC), see [RRAMC — Resistive random access memory controller](#) on page 48.

The Arm Cortex-M33 CPU can access RRAM using the C-AHB (code) bus as shown in [Memory layout](#) on page 13. The code bus (C-AHB) interface is used for any instruction fetch or data access fetch to the code region of the Arm memory model. C-AHB bus access is cached, see [CACHE — Instruction/data cache](#) on page 31.

RRAM can also be accessed by FLPR. FLPR does not share the instruction cache with the Cortex-M33; it has its own built-in, dedicated cache that is only available to VPR. The regular [CACHE — Instruction/data cache](#) on page 31 is dedicated to the Cortex-M33 and is not available to FLPR.

3.5.3 Memory map

The complete memory map is shown in the following figure.

Figure 3: Memory map

3.5.4 Instantiation

ID	Base address	Instance	TrustZone			Split access	Description
			Map	Att	DMA		
32	0x50020000	USBHSCORE : S	US	S	SA	No	USBHSCORE

Table 11: Instantiation table

4 Application core

4.1 Arm Cortex-M33 CPU

4.1.1 CPU

The Arm Cortex-M33 processor has a 32-bit instruction set (Thumb[®]-2 technology) that implements a super set of 16- and 32-bit instructions to maximize code density and performance.

This processor has the following features that enable energy-efficient arithmetic and high-performance signal processing:

- Digital signal processing (DSP) instructions:
 - Single-cycle multiply and accumulate (MAC) instructions
 - 8- and 16-bit single instruction multiple data (SIMD) instructions
- Hardware divide
- Single-precision floating-point unit (FPU)
- Memory Protection Unit (MPU)
- Arm TrustZone for Armv8-M
- Stack limit checking

The [Arm Cortex Microcontroller Software Interface Standard \(CMSIS\)](#) is implemented and available for the processor.

Real-time execution is highly deterministic in Thread mode, to and from sleep modes, and when handling events at configurable priority levels via the Nested Vectored Interrupt Controller (NVIC).

Instruction cache on the C-bus (code bus) of the Cortex-M33 CPU improves performance when fetching instructions (or data) from internal non-volatile memory. For more information on cache, see [CACHE — Instruction/data cache](#) on page 31. CPU performance parameters including wait states for configurations, CPU current consumption and efficiency, and processing power and efficiency based on the CoreMark benchmark can be found in [CPU Electrical specification](#) on page 1258.

4.1.1.1 Floating point interrupt

The floating point unit (FPU) may generate exceptions, for example, due to overflow or underflow. These exceptions may trigger interrupts when enabled in the FPU peripheral. For information on the FPU interrupts, see [CPUC — CPU control](#) on page 22.

4.1.1.2 CPU and support module configuration

The Arm Cortex-M33 processor has a number of CPU options and support modules implemented on the device.

Option	Description	Implemented
WIC	Wakeup Interrupt Controller	No
Endianness	Memory system endianness	Little endian
DWT	Data Watchpoint and Trace	Yes

Table 12: Core options

Module	Description	Implemented
MPU	Number of non-secure MPU regions	16
	Number of secure MPU regions	16
SAU	Number of SAU regions	4
FPU	Floating-point unit	Yes
DSP	Digital Signal Processing Extension	Yes
Arm TrustZone for Armv8-M	Armv8-M Security Extensions	Yes
CPIF	Coprocessor interface	No
ETM	Embedded Trace Macrocell	Yes
ITM	Instrumentation Trace Macrocell	Yes
MTB	Micro Trace Buffer	No
CTI	Cross Trigger Interface	No
BPU	Breakpoint Unit	Yes
INITSVTOR	Initial secure vector table offset	0x00000000
INITNSVTOR	Initial non-secure vector table offset	0x00000000

Table 13: Modules

4.1.2 CPUC — CPU control

CPUC controls elements of the Arm Cortex-M33 processor such as enabling floating-point exceptions. It is also able to lock certain features of the CPU and prevent them from being modified.

CPUC can generate events and CPU interrupts for exceptions in the floating point unit (FPU), as shown in the following block diagram. Examples of such exceptions are divide-by-zero or floating-point overflow.

Figure 4: Block diagram

CPUC holds a CPU identifier **CPUID**, used in the system to uniquely identify the processing unit of a core.

In addition, CPUC holds a **LOCK** register, which is used to lock certain CPU features and prevent them from being modified. One example is the **LOCK.LOCKSAU** field. When set to **Locked**, this prevents further modifications to the SAU registers.

4.1.2.1 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
CPUC	APPLICATION	0xE0080000	HF	S	NA	No	Cortex-M33 configuration

Register overview

Register	Offset	TZ	Description
EVENTS_FPUIOC	0x100		An invalid operation exception has occurred in the FPU.
EVENTS_FPUDZC	0x104		A floating-point divide-by-zero exception has occurred in the FPU.
EVENTS_FPUOFC	0x108		A floating-point overflow exception has occurred in the FPU.
EVENTS_FPUUFC	0x10C		A floating-point underflow exception has occurred in the FPU.
EVENTS_FPUIXC	0x110		A floating-point inexact exception has occurred in the FPU.
EVENTS_FPUIDC	0x114		A floating-point input denormal exception has occurred in the FPU.
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
LOCK	0x500		Register to lock the certain parts of the CPU from being modified.
CPUID	0x504		The identifier for the CPU in this subsystem.

4.1.2.1.1 EVENTS_FPUIOC

Table 14: Instantiation table

4.2 Core components

4.2.1 AMBA interconnect (AMBIX)

The AMBA interconnect (AMBIX) is a multilayer-capable bus interconnect that provides low latency access from Managers to Subordinates.

Manager and Subordinate connections are arranged in Manager and Subordinate pairs, allowing for a sparse bus matrix. The interconnect supports multiple concurrent transactions when targeting different Subordinates.

Some peripherals do not have the opportunity to pause incoming data. Being a low priority bus manager might cause loss of data for such peripherals upon bus contention. To avoid bus contention when using multiple bus managers, follow these guidelines:

- Avoid situations where more than one bus manager is accessing the same RAM subordinate.
- If more than one bus manager is accessing the same RAM subordinate, make sure that the bus bandwidth is not exhausted.

The interconnect enforces the TrustZone secure/non-secure attributes and is configured using [MPC — Memory Privilege Controller](#) on page 189.

4.2.1.1 AMBIX00 bus Managers and priority handling

The interconnect (AMBIX00) has a bus matrix that handles bus arbitration.

AMBIX00 uses a round robin bus manager arbitration algorithm.

4.2.1.2 AMBIX00 override configuration

The main interconnect (AMBIX00) has a configurable bus matrix.

The overrides are used to configure the secure and non-secure memory regions in the device. They are also used to prevent or grant access to read, write, or execute from the memory region. For more details, see [MPC — Memory Privilege Controller](#) on page 189.

4.2.2 EasyDMA

EasyDMA is a module implemented by some peripherals as a bus manager for direct access to RAM. Not all EasyDMA instances can access non-volatile memory.

A peripheral can implement multiple EasyDMA instances to provide dedicated channels. For example, a channel can be dedicated for reading and writing data between the peripheral and RAM. This concept is illustrated in the following example figure, where READER is reading data from RAMc, while WRITER is writing data to RAMa and RAMb (each RAM being separate bus subordinates).

Figure 5: EasyDMA example

4.2.2.1 EasyDMA channel implementation

A typical EasyDMA channel is implemented in the following way.

```

READERBUFFER_SIZE 5
WRITERBUFFER_SIZE 6

uint8_t readerBuffer[READERBUFFER_SIZE] __at__ 0x20000000;
uint8_t writerBuffer[WRITERBUFFER_SIZE] __at__ 0x20000005;

// Configuring the READER channel
MYPERIPHERAL->READER.MAXCNT = READERBUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &readerBuffer;

// Configure the WRITER channel
MYPERIPHERAL->WRITER.MAXCNT = WRITERBUFFER_SIZE;
MYPERIPHERAL->WRITER.PTR = &writerBuffer;

```

This example shows a peripheral called MYPERIPHERAL that implements two EasyDMA channels. One channel is for reading called READER, and one for writing called WRITER. When the peripheral starts, it performs the following tasks.

1. Reads 5 B from the readerBuffer located in RAM at address 0x20000000.

2. Processes the data.
3. Writes up to 6 B back to the writerBuffer located in RAM at address 0x20000005.

The memory layout of these buffers is illustrated is shown in the following figure.

0x20000000	readerBuffer[0]	readerBuffer[1]	readerBuffer[2]	readerBuffer[3]
0x20000004	readerBuffer[4]	writerBuffer[0]	writerBuffer[1]	writerBuffer[2]
0x20000008	writerBuffer[3]	writerBuffer[4]	writerBuffer[5]	

Figure 6: EasyDMA memory layout

The specified size of the WRITER.MAXCNT register must not be larger than the actual size of the buffer (writerBuffer). This prevents the channel from overflowing the writerBuffer.

Once an EasyDMA transfer is complete, the CPU reads the AMOUNT register to see how many bytes were transferred. For example, the CPU can read the MYPERIPHERAL.WRITER.AMOUNT register to see how many bytes WRITER wrote to RAM.

Note: A READER or WRITER PTR register must point to a valid memory region before using EasyDMA. The reset value of a PTR register is not guaranteed to point to valid memory. See [Memory](#) on page 13 for more information about the memory regions and EasyDMA connectivity.

4.2.2.2 EasyDMA error handling

Errors can occur during DMA handling.

If READER.PTR or WRITER.PTR is not pointing to a valid memory region, an EasyDMA transfer could HardFault or cause RAM corruption. See [Memory](#) on page 13 for more information about the different memory regions.

An EasyDMA channel is an AHB bus Manager. If several AHB Managers try to access the same AHB Subordinate at the same time, AHB bus congestion can occur. Depending on the peripheral, the peripheral could either stall and wait for access to be granted, or lose data.

4.2.2.3 Array list

EasyDMA can operate in Array List mode.

The Array List mode is implemented in channels where the LIST register is available.

The array list is not able to specify where the next item in the list is located. Instead, it assumes that the list is organized as a linear array where items are located one after the other in RAM.

The EasyDMA array list is implemented with the data structure `ArrayList_type`. This is illustrated in the following code example using a READER EasyDMA channel as an example.

```
#define BUFFER_SIZE 4

typedef struct ArrayList
{
    uint8_t buffer[BUFFER_SIZE];
} ArrayList_type;

ArrayList_type ReaderList[3] __at__ 0x20000000;

MYPERIPHERAL->READER.MAXCNT = BUFFER_SIZE;
MYPERIPHERAL->READER.PTR = &ReaderList;
MYPERIPHERAL->READER.LIST = MYPERIPHERAL_READER_LIST_ArrayList;
```

The data structure includes a buffer that is equal in size to the `READER.MAXCNT` register. EasyDMA uses the `READER.MAXCNT` register to determine when the buffer is full.

Figure 7: EasyDMA array list

4.2.3 CACHE — Instruction/data cache

The cache is two-way set associative with a least recently used (LRU) replacement policy. Both instruction and data accesses towards NVM memory are cached.

The cache has the following features:

- 4x64-bit cache line
- Ability to enable/disable cache at run-time
- Writes to cached memory are write-around and invalidate the cache line
- Manual invalidation and erase support
- Locking cache updates on cache misses
- Performance hit/miss counter registers for profiling CACHE operations
- Optional readable cache content for profiling
 - Data, tag, valid, and most recently used (MRU) bits
 - Can be disabled when not in use

The cache must be enabled by the `ENABLE` register. Upon enabling, the cache automatically invalidates the cache memory.

4.2.3.1 Architecture

The following figure shows the cache architecture.

Figure 8: Cache overview

Bit	Name	Description
V	Valid	Indicates if a cache entry is valid. All V fields are cleared when enabling the cache, invalidating the cache, or when changing CACHE mode.
MRU	Most Recently Used	Updated on each fetch from the cache to indicate which Way was used most recently. Used to drive the cache replacement policy.

4.2.3.2 Profiling

The cache provides a scoreboard that tracks the hits and misses within the cache.

The results are available through a set of registers that can be used to indicate how well the cache is performing.

Profiling is enabled using [PROFILING.ENABLE](#). All profiling counters can be cleared at any time using [PROFILING.CLEAR](#). After being cleared, the counters will increment, according to the rules in the table below, at the next instruction- or data fetch.

Profiling counter	Description
HIT	Incremented on a cache hit
MISS	Incremented on a cache miss (not counting write misses)
LMISS	Incremented when accessing different line than was accessed last time
READS	Incremented on a CPU read
WRITES	Incremented on a CPU write

Table 15: Profiling counters

4.2.3.3 Debug

The CPU is able to read internal cache memories and tags for debug purposes.

The content of data and tag RAM's are accessible through registers [SET\[n\].WAY\[o\].INFO](#) (n=0..127) (o=0..1) on page 38 and [SET\[n\].WAY\[o\].DU\[p\].DATA\[q\]](#) (n=0..127) (o=0..1) (p=0..3) (q=0..1) on page 39.

Debug access is prevented by using register [DEBUGLOCK](#) on page 37.

4.2.3.4 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
ICACHE	APPLICATION	0xE0082000	HF	S	NA	No	Instruction cache

Configuration

Instance	Domain	Configuration
ICACHE	APPLICATION	Cache size: 8 KB. Sets: 128. Data unit: 64 bits. Line width = 4 data units. Supports line invalidation Supports cache erase Supports cache line maintain Supports extended profiling registers (LMISS / READS / WRITES) Supports debug lock Supports write lock Data bus width : 0..63

Register overview

Register	Offset	TZ	Description
TASKS_INVALIDATECACHE	0x008		Invalidate the cache.
TASKS_INVALIDATELINE	0x014		Invalidate the line.
TASKS_ERASE	0x020		Erase the cache.
STATUS	0x400		Status of the cache activities.
ENABLE	0x404		Enable cache.
LINEADDR	0x410		Memory address covered by the line to be maintained.
PROFILING.ENABLE	0x414		Enable the profiling counters.
PROFILING.CLEAR	0x418		Clear the profiling counters.
PROFILING.HIT	0x41C		The cache hit counter for cache region.
PROFILING.MISS	0x420		The cache miss counter for cache region.
PROFILING.LMISS	0x424		The cache line miss counter for cache region.
PROFILING.READS	0x428		Number of reads for cache region.
PROFILING.WRITES	0x42C		Number of writes for cache region.
DEBUGLOCK	0x430		Lock debug mode.
WRITELOCK	0x434		Lock cache updates.

4.2.3.4.1 TASKS_INVALIDATECACHE

Address offset: 0x008

Invalidate the cache.

The **STATUS** is updated for this task. This task can be triggered only when the **STATUS** is ready.

4.2.4 FICR — Factory information configuration registers

Factory information configuration registers (FICR) are pre-programmed in factory. These registers contain chip-specific information and configuration.

4.2.4.1 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
FICR	GLOBAL	0x00FFC000	HF	NS	NA	No	Factory information configuration

Register overview

Register	Offset	TZ	Description
INFO.CONFIGID	0x300		Configuration identifier
INFO.DEVICEID[n]	0x304		Device identifier
INFO.UUID[n]	0x30C		128-bit Universally Unique Identifier (UUID).
INFO.PART	0x31C		Part code
INFO.VARIANT	0x320		Function variant code, Hardware version code, and Production configuration code encoded as ASCII.
INFO.PACKAGE	0x324		Package option
INFO.RAM	0x328		RAM size (KB)
INFO.RRAM	0x32C		RRAM size (KB)
ER[n]	0x380		Common encryption root key, word n
IR[n]	0x390		Common identity root key, word n
DEVICEADDRTYPE	0x3A0		Device address type
DEVICEADDR[n]	0x3A4		Device address n
TRIMCNF[n].ADDR	0x400		Address of the register which will be written
TRIMCNF[n].DATA	0x404		Data to be written into the register
NFC.TAGHEADER0	0x600		Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST.
NFC.TAGHEADER1	0x604		Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST.
NFC.TAGHEADER2	0x608		Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST.
NFC.TAGHEADER3	0x60C		Default header for NFC Tag. Software can read these values to populate NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST.
XOSC32MTRIM	0x620		XOSC32M capacitor selection trim values
XOSC32KTRIM	0x624		XOSC32K capacitor selection trim values

4.2.4.1.1 INFO

Device info

4.2.4.1.1.1 INFO.CONFIGID

Address offset: 0x300

Configuration identifier

			Unspecified	0xFFFFFFFF		Unspecified																													

4.2.4.1.1.5 INFO.VARIANT

Address offset: 0x320

Function variant code, Hardware version code, and Production configuration code encoded as ASCII.

The VARIANT register is an ASCII encoded string of the form <VV> <H> <P>, where <VV> is the Function variant code, <H> is the Hardware version code, and <P> is the Production configuration code.

See the Ordering information chapter for more details on the function variant code, hardware version code, and production configuration code.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0xFFFFFFFF				1 1																															
ID	R/W	Field	Value ID	Value			Description																												
A	R	VARIANT					Function variant code, Hardware version code, and Production configuration code encoded as ASCII																												
			AAB0	0x41414230			Example encoding for AAB0 - Function variant code AA, Hardware version code B, Production configuration code 0																												
			Unspecified	0xFFFFFFFF			Unspecified																												

4.2.4.1.1.6 INFO.PACKAGE

Address offset: 0x324

Package option

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

4.2.5 MEMCONF — Memory configuration

MEMCONF provides power control for RAM blocks.

Each RAM block can independently power up or power down in System ON and System OFF mode. RAM blocks can contain multiple RAM sections. For more information about System ON and System OFF modes, see [Power and clock management](#) on page 69. For an overview of available RAM blocks and RAM sections, see [Memory](#) on page 13.

MEMCONF registers are used for configuring the following:

- RAM sections to be retained during System OFF mode
- RAM sections to be retained and accessible during System ON mode

In System OFF mode, a RAM section is retained by configuring the corresponding MEM[i] field of the [RET](#) register.

In System ON mode, retention and accessibility for a RAM section is configured in the corresponding MEM[i] field of register [POWER\[n\].CONTROL \(n=0..1\)](#) on page 48.

A complete list of blocks (RET.MEM[i], RET2.MEM[i], and CONTROL.MEM[i]) are found in the following table.

Block number (index i in MEMCONF.POWER)	RAM section	RET reset value	CONTROL reset value
0	RAM00 section 0	1	1
1	RAM00 section 1	1	1
2	RAM00 section 2	1	1
3	RAM00 section 3	1	1
4	RAM00 section 4	1	1
5	RAM00 section 5	1	1
6	RAM00 section 6	1	1
7	RAM00 section 7	1	1
8	RAM01 section 0	1	1
9	RAM01 section 1	1	1
10	RAM01 section 2	1	1
11	RAM01 section 3	1	1
12	RAM01 section 4	1	1
13	RAM01 section 5	1	1
14	RAM01 section 6	1	1
15	RAM01 section 7	1	1
33	ICACHE tag + data 1:0	0	1
34	USBHS	0	1

Table 16: Memory block overview with MEMCONF.POWER configuration

A list of features that are retained using MEMCONF are found in the following table.

Block number (index i in MEMCONF.POWER)	Feature	RET reset value	Description
32	Restore VPR context at VPR reset	0	Enables VPR context restore from RAM after VPR reset, where the VPR reset maybe caused by a wakeup from hibernate. ¹

Table 17: Feature overview with MEMCONF.POWER.RET configuration

The following table summarizes the behavior of the CONTROL and RET fields when a power domain is powered on or off. The RAM section can be used to read and write data when it is powered. The RAM section is retained during System OFF.

Configuration			RAM section status	
Power mode	CONTROL	RET	Powered	Retained
System OFF	Any value	Off	No	No
System OFF	Off	On	No	No
System OFF	On	On	No	Yes
System ON IDLE	Off	Any value	No	No
System ON IDLE	On	Any value	No	Yes
System ON RUN	Any value	Any value	Yes	Yes

Table 18: RAM section configuration

The advantage of not retaining RAM content is reduced overall current consumption.

See chapter [Memory](#) on page 13 for more information on RAM sections.

Note: [CACHE — Instruction/data cache](#) on page 31 must be disabled when the ICACHE memory block is turned off, and only enabled after the ICACHE memory block is turned on.

4.2.5.1 Registers

Instances

								All other RAM will be off in System OFF mode.																											
			Off	0				Retention off																											
			On	1				Retention on																											

4.2.6 RRAMC — Resistive random access memory controller

The resistive random access memory controller (RRAMC) is used for writing the internal RRAM memory, the secure information configuration region (SICR), and the user information configuration registers (UICR).

The main features of RRAMC are:

- Write and overwrite without erasing
- 128-bit data unit with built in error correction code (ECC), detecting and correcting up to two bit errors per data unit
- Automatic standby or power-down modes
- One-time programmable (OTP) protection for user information configuration registers (UICR)
- Optional immutable boot region protection

4.2.6.1 Reading from RRAM

RRAM can be read using any natural alignment.

Read and execute operations are cachable through [CACHE — Instruction/data cache](#) on page 31. For execution performance figures, see [CPU](#) on page 21.

Low latency mode

The [POWER.LOWPOWERCONFIG](#) and [POWER.STANDBYCONFIG](#) registers allow trading off between latency and power consumption. To minimize wake-up latency from sleep mode, configure [POWER.LOWPOWERCONFIG.MODE](#) to be Standby. For further latency reduction, configure [POWER.STANDBYCONFIG.MODE](#) to also be Standby, which keeps RRAM in standby mode while the system is clocked.

When combined with Constant Latency sub-power mode, these settings provide the lowest possible RRAM access latency.

4.2.6.2 Writing to RRAM

When writing is enabled in register [CONFIG.WEN](#), and [CONFIG.WRITEBUFSIZE](#) is set to `Unbuffered`, RRAM is written using any natural alignment (byte, half-word, 32-bit, or 64-bit).

RRAMC always writes full data units. When data is written to RRAM, the entire data unit is written and ECC is updated, even if only a single bit is changed. This has an effect on the endurance of the RRAM, as each write operation counts as a write to all bits in the data unit.

RRAMC is able to write both 0 and 1 to any bit in RRAM, even if that bit has been written before.

When writing with [CONFIG.WRITEBUFSIZE](#) set to `Unbuffered`, the written data (byte, half-word, 32-bit, or 64-bit) is committed to RRAM immediately.

4.2.6.2.1 Buffered RRAM write

RRAMC enables fast buffered writes for contiguous memory regions.

RRAMC has an internal write-buffer that can be configured using [CONFIG.WRITEBUFSIZE](#).

When buffered writes are enabled, RRAMC will collect as much data as possible in the internal write-buffer, before bulk-committing the buffer to RRAM.

When committing to RRAM, the commit operation updates only the data in RRAM memory that has modified values. Values that have not been altered remain unchanged in RRAM.

To use buffered writes, perform the following operations:

1. Enable writing using [CONFIG.WEN](#), and configure [CONFIG.WRITEBUFSIZE](#).
2. Write to RRAM memory in incrementing address order.

RRAMC commits the write-buffer when either of the following occurs:

- The write-buffer is full
- The address written is outside the buffer area
- There is a read operation from a 128-bit data unit in the buffer that has already been written to

RRAMC stalls while the commit takes place, and additional wait-states can be observed for the bus access.

In addition to the automatic commit, a commit can also be triggered by the following:

- After a time-out waiting for a new write operation, configured in [READYNEXTTIMEOUT](#)
- When the [COMMITWRITEBUF](#) task is triggered

The manual triggers are useful in situations where it is crucial to ensure that the write buffer has been committed. Register [BUFSTATUS.WRITEBUFEMPTY](#) can be used to check if the write-buffer is empty, or if it contains uncommitted data.

Note: The internal write-buffer is volatile, and data loss may occur during a power failure or when entering System OFF mode with uncommitted data in the buffer. Ensure that the write-buffer is empty (see [BUFSTATUS.WRITEBUFEMPTY](#) on page 58) and that [READY](#) on page 58 is set before entering System OFF. When entering sleep in System ON mode, having uncommitted data in the internal write-buffer will keep the RRAM active, and thus increase power consumption.

4.2.6.3 Erasing RRAM

RRAMC provides a mechanism to erase the whole RRAM in one operation by using the [ERASE.ERASEALL](#) register.

When ERASEALL is triggered, RRAMC will write `0xFFFFFFFF` to the entire RRAM memory, including user information configuration registers (UICR) and the secure information configuration region (SICR). ERASEALL will not erase the factory information configuration registers (FICR).

This functionality can be blocked by ERASE protection. For details, see [CTRL-AP — Control access port](#) on page 1181.

Note: Unlike the CTRL-AP ERASEALL operation that can be activated from a debugger, the RRAMC ERASEALL operation will not automatically grant access to the debug access port.

Note: The write-buffer must be committed before initiating an erase operation.

4.2.6.4 Region protection

The RRAM memory can be divided into several regions and these regions can be configured to restrict accesses.

Each region is configured using the [REGION\[n\].ADDRESS](#) and [REGION\[n\].CONFIG](#) registers.

When the region write-once feature is enabled, writes to a 32-bit words in the region are allowed only when the current data is `0xFFFFFFFF`, else the writes are ignored.

When the region configuration registers are writable, the region configuration registers can be updated until the lock bit is set to `Enabled`. However, the register fields Secure, Read, Write, and Execute can be written to 0, even if the lock bit is set to `Enabled`.

After changing the region protection, [CACHE](#) must be invalidated to stay coherent with the updated RRAM configuration. Failure to do so will cause unpredictable results, such as being able to read cached content from a memory region that was just configured to be non-readable.

Note: The configuration registers for some of the regions are read-only and are reserved by the system configurations. See the register configuration table below for regions available for users.

4.2.6.5 Immutable boot region

RRAMC can make a part of the RRAM code memory immutable.

The immutable boot region has configurable permissions settings. Read, write, and execute permissions are configured individually. By making the region read-execute only, that memory range of the RRAM becomes immutable.

The region starts at address 0x00000000 and the size of the region is configurable. Note that the region does not add additional storage, but enforces permission settings on the memory range.

The size and permission settings of the immutable boot region is configured in [UICR](#). If [UICR.BOOTCONF](#) is not configured, RRAMC will not enforce the protection.

Once the boot region protection is enabled, it can only be removed by ERASEALL. Erase protection can be enabled to prevent ERASEALL operation. For more information about erase protection, see [CTRL-AP — Control access port](#) on page 1181.

4.2.6.6 Power-failure protection

Power failure protection is possible by using the power-fail comparator (POF) that is monitoring power supply.

If the power-fail comparator is enabled, and the power supply voltage is below the POF threshold, the power-fail comparator will prevent RRAMC from performing write operations. For more information about POF, see [Power-fail comparator](#) on page 71.

If a power failure warning is present at the start of an RRAM write operation, RRAMC will block the operation and a bus error will be signaled.

If a power failure warning occurs during an ongoing RRAM write, RRAMC can be configured to handle this in two ways:

- If [POWER.CONFIG.POF](#) = `Abort`, then RRAMC will stop the commit process from the internal write-buffer as soon as the condition occurs. After a power-failure event, the write buffer must be cleared by using the [CLRWRITEBUF](#) task before writing more data to RRAM.
- If [POWER.CONFIG.POF](#) = `Wait`, then RRAMC will try to complete the on-going write despite the warning of the operating voltage becoming too low.

4.2.6.7 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
RRAMC	GLOBAL	0x5004E000	HF	S	NA	No	RRAM Non-Volatile Memory Controller

Configuration

Instance	Domain	Configuration
RRAMC	GLOBAL	RRAMC.REGION[4] is available for use, other regions are reserved for the system. RRAM data unit size : 128 bits per data unit Maximum write buffer size : 32

Register overview

Register	Offset	TZ	Description
TASKS_WAKEUP	0x000		Wakeup the RRAM from low power mode
TASKS_CLRWRITEBUF	0x004		Clear internal write-buffer
TASKS_COMMITWRITEBUF	0x008		Commits the data stored in internal write-buffer to RRAM
SUBSCRIBE_WAKEUP	0x080		Subscribe configuration for task WAKEUP

Register	Offset	TZ	Description
SUBSCRIBE_CLRWRITEBUF	0x084		Subscribe configuration for task CLRWRITEBUF
SUBSCRIBE_COMMITWRITEBUF	0x088		Subscribe configuration for task COMMITWRITEBUF
EVENTS_WOKENUP	0x100		RRAMC is woken up from low power mode
EVENTS_READY	0x104		RRAMC is ready
EVENTS_READYNEXT	0x108		Ready to accept a new write operation
EVENTS_ACCESSERROR	0x10C		RRAM access error
PUBLISH_WOKENUP	0x180		Publish configuration for event WOKENUP
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
READY	0x400		RRAMC ready status
READYNEXT	0x404		Ready next flag
ACCESSERRORADDR	0x408		Address of the first access error
BUFSTATUS.WRITEBUFEMPTY	0x418		Internal write-buffer is empty
ECC.ERRORADDR	0x420		Address of the first ECC error that could not be corrected
CONFIG	0x500		Configuration register
READYNEXTTIMEOUT	0x50C		Configuration for ready next timeout counter, in units of AXI clock frequency
POWER.CONFIG	0x510		Power configuration
POWER.STANDBYCONFIG	0x514		Standby mode configuration
POWER.LOWPOWERCONFIG	0x518		Low power mode configuration
ERASE.ERASEALL	0x540		Erase RRAM, including UICR All information in SICR, including keys, are also erased
REGION[n].ADDRESS	0x550		Region address
REGION[n].CONFIG	0x554		Region configuration

4.2.6.7.1 TASKS_WAKEUP

ID	R/W	Field	Value ID	Value	Description																																
A	RW	ACCESSTIMEOUT			Access timeout, in 31.25 ns units, used for going into standby power mode or remain active on wake up																																
					The timeout counter counts down and is restarted on every RRAM access and on event WOKENUP																																
B	RW	POF			Power on failure warning handling configuration																																
			Wait	0	Wait until the current RRAM write finishes																																
			Abort	1	Abort the current RRAM write																																

4.2.6.7.24 POWER.STANDBYCONFIG

Address offset: 0x514

Standby mode configuration

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			A A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	MODE			RRAM standby mode																													
			Normal	0	The RRAM automatically goes into idle mode while the RRAM is not being accessed																													
			PowerDown	2	The MCU power domain is turned off. The RRAM goes into power down mode when the access timeout counter is expired																													
					The penalty for RRAM access during wakeup from PowerDown mode is about 6µs																													
			Standby	3	The RRAM remains active while the RRAM is not being accessed. Access to RRAM has the lowest latency when MCU PD is in RUN state, for example by using Constant Latency sub-power mode. ACCESSTIMEOUT has no effect in this mode.																													

4.2.6.7.25 POWER.LOWPOWERCONFIG

Address offset: 0x518

Low power mode configuration

The RRAMC low power mode is entered while the device goes into system on idle

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
ID																																				A	A
Reset 0x00000000				0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
ID	R/W	Field	Value ID	Value	Description																																
A	RW	MODE			RRAM low power mode																																
			PowerOff	0	The RRAM is powered Off																																
			Standby	1	The RRAM automatically goes into standby mode while the RRAM is not being accessed																																
					This mode gives faster wake-ups, and is useful in combination with Constant Latency sub-power mode.																																

4.2.6.7.26 ERASE.ERASEALL

Address offset: 0x540

Erase RRAM, including UICR

All information in SICR, including keys, are also erased

The status in **READY** is updated during this operation

Writes to this register are ignored when erase protect is enabled

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

G	RW	SIZE			Size in KBytes of region [n]																														

4.2.7 SICR — Secure information configuration region

The secure information configuration region (SICR) is reserved for keys and device unique seed.

Access to SICR is managed by [KMU — Key management unit](#) on page 179. Bus transactions originating from CPU or other peripherals are blocked.

4.2.8 SWI — Software interrupts

A set of interrupts have been reserved for use as software interrupts.

These interrupts can be enabled and triggered by software by using the Arm Cortex-M33 NVIC registers, as described in the *Arm Cortex-M33 Processor Technical Reference Manual*.

4.2.8.1 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
SWI00	APPLICATION	0x5001C000	HF	S	NA	No	Software interrupt SWI00
SWI01	APPLICATION	0x5001D000	HF	S	NA	No	Software interrupt SWI01
SWI02	APPLICATION	0x5001E000	HF	S	NA	No	Software interrupt SWI02
SWI03	APPLICATION	0x5001F000	HF	S	NA	No	Software interrupt SWI03

4.2.9 UICR — User information configuration registers

The user information configuration registers (UICR) are non-volatile memory (NVM) registers that configure user specific settings and values for emulated one-time programmable (OTP).

All UICR registers have a write-once protection that allow them to be read multiple times, but written only once when UICR has been erased by the Erase All operation.

For information on writing registers, see [RRAMC — Resistive random access memory controller](#) on page 48 and [Memory](#) on page 13.

Notice that all access port protection registers are duplicated into PROTECT0/PROTECT1. For optimal security, set both registers set to "random" values different from the Unprotected value. For ERASEPROTECT, set both PROTECT0/PROTECT1 registers to the Protected value.

4.2.9.1 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
UICR	GLOBAL	0x00FFD000	HF	S	NA	No	User information configuration

Register overview

Register	Offset	TZ	Description

A	RW1	PALL	Protected	0x50FA50FA								Erase protection is enabled and the signal protector is locked.																							

4.2.9.1.5 BOOTCONF

Address offset: 0x080

Immutable boot region configuration.

If this register is not equal to 0xFFFFFFFF, RRAMC applies these settings at device reset, to form the immutable boot region.

For an immutable bootloader, recommended value is READ, EXECUTE, SECURE, WRITEONCE, LOCK, and SIZE. READ permission is needed for the CPU to read constants and instructions.

Unused bits (unused fields) must be set to zero.

Note: After ERASEALL, a reset is required before the factory default settings are applied.

5 Power and clock management

The power and clock management system is optimized for ultra-low power applications to provide maximum power efficiency.

The power and clock management system is shown in the following figure.

Figure 9: Power and clock management

The power and clock management system automatically tracks the power and clock resources requested by components in the system at any given time. To achieve the lowest power consumption possible, the system evaluates the requests, starts and stops clock sources, and chooses the most optimal regulator operation modes.

The device start-up sequence after reset is described in [RESET — Reset control](#) on page 109.

5.1 System ON mode

System ON is the default operation mode after power-on reset.

In System ON, all functional blocks, such as the CPU and peripherals, can be in an IDLE or RUN state depending on the configuration set by the software and the state of the executing application.

The power and clock management unit can switch the appropriate internal power domains on and off, depending on power requirements. A peripheral's power requirement is directly related to its activity level, which increases and decreases when specific tasks are triggered or events are generated.

5.1.1 Sub-power modes

In System ON mode, the system can reside in one of the two sub-power modes when the CPU and all peripherals are in an IDLE state.

The sub-power modes are the following:

- Constant Latency
- Low-power

In Constant Latency mode, the CPU wakeup latency and the PPI task response are constant and kept at a minimum. This is secured by forcing a set of basic resources to be turned on while in sleep mode. Constant

and predictable latency increases power consumption. Constant Latency mode is selected by triggering the task [CONSTLAT](#).

In Low-power mode, the automatic power management system described in System ON mode ensures that the most efficient supply option is chosen to save power. The lowest possible power consumption comes at a cost of a varying CPU wakeup latency and PPI task response. Low-power mode is selected by triggering the task [LOWPWR](#).

When the system enters System ON mode, it is in the sub-power mode Low-power by default.

5.2 System OFF mode

System OFF is the deepest power-saving mode the system can enter. In this mode, the system's core functionality is powered down and most ongoing tasks are stopped.

Register [SYSTEMOFF](#) on page 107 sets the device into System OFF mode. The following wakeup sources will initiate a wakeup from System OFF:

- The DETECT signal generated by the GPIO peripheral
- The ANADETECT signal generated by the LPCOMP peripheral
- The SENSE signal generated by the NFCT peripheral to wake-on-field
- The SYSCOUNTER compare event generated by the GRTC peripheral
- A valid USB voltage on the **VBUS** pin is detected, and again when the VBUS voltage falls below the valid range
- A debug session is started
- A pin reset

When the device wakes up from System OFF, a system reset is performed. For more details, see [Reset behavior](#) on page 111.

One or more RAM sections can be retained in System OFF depending on the RAM retention settings configured in [MEMCONF — Memory configuration](#) on page 46.

Before entering System OFF mode, the following conditions must be met.

- All on-going EasyDMA transactions must finish. See peripheral specific chapters for more information about how to get the status of EasyDMA transactions.
- The 32 MHz oscillator (HFXO) must be stopped. Stop HFXO with the [XOSTOP](#) task. The 32 kHz oscillator (LFXO) can be running.
- The register [RESET.RESETREAS](#) must be cleared. Failure to do so can make the system immediately wake up from System OFF mode.

5.2.1 Emulated System OFF mode

When the device is in Debug Interface mode, System OFF is emulated to ensure that all resources required for debugging are available during System OFF.

Resources required for debugging include the following key components:

- [Debug Interface mode](#) on page 1179
- [CLOCK — Clock control](#) on page 72
- [POWER — Power control](#) on page 100
- [OSCILLATORS — Oscillator control](#) on page 94
- [REGULATORS — Regulator control](#) on page 105
- [RESET — Reset control](#) on page 109
- [CPU](#) on page 21
- [Memory](#) on page 13

Because the CPU is kept on in an emulated System OFF mode, it is recommended to add an infinite loop directly after entering System OFF. This prevents the CPU from executing code that normally should not be executed. For more information, see [Debug and trace](#) on page 1174.

5.3 Power supply supervisors

The power supply supervisors monitor the connected power supply and provide the following functionality.

- Power-on reset (POR) — signals the circuit when a supply is connected
- Fixed brownout reset detector (BOR) — holds the system in reset when the voltage is too low for safe operation
- Optional power-fail comparator (POF) — signals the application when the supply voltage drops below a configured threshold

The power supply supervisors are illustrated in the following figure.

Figure 10: Power supply supervisors

5.3.1 Power-fail comparator

Using the power-fail comparator (POF) is optional. When enabled, it notifies the CPU of a potential power supply failure.

The POF can measure the voltage on **VDD**. To enable and configure the POF, see register [POFCON](#) on page 107.

When the supply voltage falls below the defined threshold, the POF generates an event **POFWARN** that can be used by an application to prepare for power failure. This event is also generated when the supply voltage is already below the threshold at the time the POF is enabled, or if the threshold is reconfigured to a level above the supply voltage. **POFWARN** is disabled using the **EVENTDISABLE** field of [REGULATORS.POFCON](#). In addition to the event, the result of the POF is found using [POFSTAT](#) on page 108.

POFWARN prevents RRAMC from performing write operations to the non-volatile memory. See [RRAMC — Resistive random access memory controller](#) on page 48 for more information about non-volatile memory.

The POF features a hysteresis of V_{HYST} , as illustrated in the following figure.

Figure 11: Power-fail comparator

To save power, the POF is not active in System ON when the HFCLK is not running, or in System OFF.

To measure the voltage, perform the following steps.

1. Disable POWARN by writing `Disabled` to `REGULATORS.POFCON.EVENTDISABLE`.
2. Enable POF by writing `Enabled` to `REGULATORS.POFCON.POF`.
3. Loop over all threshold voltages by writing a threshold voltage into register `REGULATORS.POFCON.THRESHOLD`, starting at the lowest value enumerator until `REGULATORS.POFSTAT` toggles. This toggle indicates that the voltage has been found and can be read from register `REGULATORS.POFCON.THRESHOLD`.

5.4 CLOCK — Clock control

The clock control system sources the system clocks from internal or external high and low frequency oscillators. It distributes the clocks to modules based on their requirements. Clock distribution is automated and grouped independently by module to limit current consumption in unused branches of the clock tree.

The following are the main features for CLOCK:

- On-chip 128 MHz phase-locked loop (PLL) with internal oscillator
- 32 MHz crystal oscillator (when using the external 32 MHz crystal)
- 32.768 kHz RC oscillator
- 32.768 kHz crystal oscillator (when using the external 32.768 kHz crystal)
- Automatic clock control and distribution

The clock control system is responsible for requesting resources from the power and clock subsystem.

Figure 12: Clock control

5.4.1 HFCLK controller

The HFCLK clock controller provides the following clocks to the system.

Clock	Description
HCLKCORE	MCU power domain and CPU clock where 64 or 128 MHz can be selected.
PCLK32M	32 MHz peripheral clock for RADIO peripherals, PDM (PCLK) and TDM (PCLK).
PCLK24M	24 MHz peripheral clock for USB, PDM (ACLK), and TDM (ACLK). PCLK24M requires HFXO to be running. See the XO24MSTART task for details, in addition to PCLK24M and HFXO for more information.
PCLK16M	16 MHz peripheral clock.
PCLK1M	1 MHz peripheral clock.

Table 19: Clocks

Clock source	Description
HFINT	128 MHz internal oscillator
HFXO	32 MHz crystal oscillator

Table 20: Sources

The following HFCLK sources generate the HFCLK clocks:

- 128 MHz internal oscillator — PLL is operating in free running mode
- 32 MHz crystal oscillator — PLL is locked on a crystal (XOSC), optionally using built-in capacitors as described in [OSCILLATORS — Oscillator control](#) on page 94.

CPUs, peripherals, and other system components automatically request clocks. The HFCLK control passes the request to the power and clock subsystem. When the clocks are running, the HFCLK control distributes them to the components. The CPU clock frequency can be selected, as described in [OSCILLATORS — Oscillator control](#) on page 94.

When all HFCLK control requests end, the HFCLK control stops requesting CLOCK from the power and clock subsystem. For example, when the CPU enters sleep or when peripherals have completed their tasks, HFCLK stops CLOCK requests. If there are no requests for HFCLK or PCLK control, the power and clock subsystem automatically stops the clock.

When the system enters System ON mode and an HFCLK clock is requested, the PLL is automatically started. When clock requests stop, the PLL automatically stops.

HFCLK clocks are only available to the HFCLK controllers when the system is in System ON mode.

An HFCLK source can run before being started by the relevant clock request. This reduces start-up time but causes increased power consumption. An example of this would be to keep the PLL running during sleep by using the task [PLLSTART](#).

HFXO must be started when crystal clock accuracy is required. The crystal is started by triggering the task [XOSTART](#). When the crystal reaches the correct amplitude and frequency, the PLL automatically locks to the crystal and generates the event [XOSTARTED](#). At the same time, the crystal oscillator is performing an XOTUNE. When that process finishes, the event [XOTUNED](#) is generated indicating the signal from the crystal oscillator is accurately tuned. The XOTUNED event is always generated after the XOSTARTED event. If the XOTUNE process fails, the event [XOTUNEDFAILED](#) is generated. When that happens, the XOTUNE process must be started by triggering the task [XOTUNE](#). The task [XOSTOP](#) will stop the crystal oscillator and the XOTUNE process (if it is running). The XOTUNE process will continue from where it left off, when the XOSTART task is triggered again.

If the crystal oscillator requires the XOTUNE process to be repeated, the device generates the event [XOTUNEERROR](#). When that happens, the [XOTUNE](#) task must be triggered. This task does not request the crystal oscillator to start and it only takes effect if the crystal oscillator is already running. Do not trigger this task at the same time that RADIO is running (meaning RADIO must not be in the RX or TX states). A successful XOTUNE process is indicated by the event [XOTUNED](#). If the procedure fails to complete, the [XOTUNEDFAILED](#) event is generated. When a failure is detected, the XOTUNE process must be repeated. Repeated failures to complete the XOTUNED process indicates a faulty crystal or load capacitors.

Note: The crystal oscillator quality indicated by the XOSTARTED event is sufficient for all peripherals except RADIO and when calibrating the 32.768 kHz oscillator. Before using RADIO, ensure that the event [XOTUNED](#) has been generated. This ensures the highest quality crystal signal is available.

A new START task can be initiated after one has already been triggered, but before the corresponding STARTED event is generated. In this case, only one STARTED event will be generated, corresponding to the last triggered START task. Triggering a START task after the STARTED event from a previous triggered START tasks is generated, generates a new STARTED event.

The amount of time between a START task and its corresponding STARTED event may differ depending on whether the HFCLK source is already running or in the process of starting. The amount of time before a STARTED event may vary when a different HFCLK source is configured before triggering a new START task. Different crystal types also have different start-up times, see [OSCILLATORS — Oscillator control](#) on page 94 for details.

HFXO must be running to use [RADIO](#), [USBHS](#), [NFCT](#), [UARTE](#), or to calibrate the 32.768 kHz RC oscillator. Using HFXO will also improve [SAADC](#) performance by reducing clock jitter. When using serial communication peripherals such as [SPIM](#), [SPIS](#), [TWIM](#), and [TWIS](#), the HFXO must be running to achieve the highest accuracy for the bit rate. When using the internal RC oscillator (HFINT), the frequency accuracy of the serial interface is limited to the accuracy of HFINT, see [High frequency clock source \(HFCLK\)](#) on page 1257.

PCLK24M and HFXO

A 24 MHz PLL generates the PCLK24M clock and requires the 32 MHz crystal oscillator (HFXO) as a reference for locking. PCLK24M is started by triggering the task [XO24MSTART](#), which requests HFXO as a reference source for the 24 MHz PLL.

When HFXO is requested through the [XO24MSTART](#) task, the crystal oscillator performs the XOTUNE process and generates the event [XOTUNED](#) when tuning completes successfully.

The [XOTUNED](#) event is generated only once when HFXO starts and completes tuning. If HFXO is already running and tuned, triggering either [XO24MSTART](#) or [XOSTART](#) will not generate a new XOTUNED event.

5.4.2 LFCLK controller

The system supports the following low frequency clock sources, as described in [Clock control](#) on page 73.

- 32.768 kHz RC oscillator (LFRC)
- 32.768 kHz crystal oscillator (LFXO)
- 32.768 kHz synthesized from HFCLK (LFSYNT)

LFXO can run in System OFF mode. The other clock sources only run in System ON mode.

The following LF clocks are available in the system.

Clock	Description
PCLK32KI	32.768 kHz peripheral low-frequency clock.
GRTC.LFLPRC	Direct path from 32.768 kHz internal oscillator (LFRC) to GRTC peripheral. Available only in System ON mode. If GRTC.LFLPRC is used, stop GRTC before entering System OFF mode.
GRTC.LFXO	Direct path from 32.768 kHz crystal oscillator (LFXO) to GRTC peripheral. Available in System ON or System OFF mode.

Table 21: Clocks

When a peripheral requires the PCLK32KI clock, the LFCLK control automatically requests the LFCLK clock for the power and clock subsystem. The default LFCLK source is the LFRC.

To use a different LFCLK source, select the preferred clock source in register [LFCLK.SRC](#) on page 92 and then trigger the [LFCLKSTART](#) task. If LFXO is selected as the clock source, LFCLK initially starts running from the 32.768 kHz LFRC then automatically switches to the crystal once available. The [LFCLKSTARTED](#) event is then generated.

When switching the LFCLK source, such as from LFRC to LFXO, up to one LFCLK cycle may be lost.

The [LFCLKSTART](#) task will request the clock to keep running until triggering the [LFCLKSTOP](#) task to stop the clock.

The LFCLK clock is stopped when there are no requests. For example, [WDT](#) is stopped, and the [LFCLKSTOP](#) task is triggered. Triggering the [LFCLKSTOP](#) task is required after the [LFCLKSTART](#) task has been triggered.

5.4.2.1 Calibrating the 32.768 kHz RC oscillator

The LFRC frequency is affected by temperature variation. LFRC can be calibrated to improve accuracy by using HFCLK as a reference oscillator during calibration.

The calibration must use the following sequence.

1. Start the LFCLK by triggering the LFCLKSTART task.

2. Start the HFCLK crystal oscillator HFXO by triggering the **XOSTART** task.
3. Wait for the **LFCLKSTARTED** and the HFXO **XOTUNED** events.
4. Trigger the **CAL** task to start the calibration process. The device automatically performs the calibration, adjusting the LFCLK frequency using HFCLK as reference. The **DONE** event is generated when calibration finishes.
5. Stop HFXO with the **XOSTOP** task.
6. Stop LFCLK with the **LFCLKSTOP** task.

LFCLK uses the calibrated value until the next calibration.

5.4.3 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
CLOCK : S	GLOBAL	0x5010E000	US	S	NA	No	Clock control
CLOCK : NS		0x4010E000					

Configuration

Register overview

Register	Offset	TZ	Description
TASKS_XOSTART	0x000		Start crystal oscillator (HFXO)
TASKS_XOSTOP	0x004		Stop crystal oscillator (HFXO)
TASKS_PLLSTART	0x008		Start PLL and keep it running, regardless of the automatic clock requests
TASKS_PLLSTOP	0x00C		Stop PLL
TASKS_LFCLKSTART	0x010		Start LFCLK source as selected in LFCLK.SRC
TASKS_LFCLKSTOP	0x014		Stop LFCLK source
TASKS_CAL	0x018		Start calibration of LFRC oscillator
TASKS_XOTUNE	0x01C		Request tuning for HFXO
TASKS_XOTUNEABORT	0x020		Abort tuning for HFXO
TASKS_XO24MSTART	0x024		Request HFXO to provide a crystal clock for PCLK24M
TASKS_XO24MSTOP	0x028		Stop request HFXO for PCLK24M. When all requests for HFXO are stopped, HFXO will also stop.
SUBSCRIBE_XOSTART	0x080		Subscribe configuration for task XOSTART
SUBSCRIBE_XOSTOP	0x084		Subscribe configuration for task XOSTOP
SUBSCRIBE_PLLSTART	0x088		Subscribe configuration for task PLLSTART
SUBSCRIBE_PLLSTOP	0x08C		Subscribe configuration for task PLLSTOP
SUBSCRIBE_LFCLKSTART	0x090		Subscribe configuration for task LFCLKSTART
SUBSCRIBE_LFCLKSTOP	0x094		Subscribe configuration for task LFCLKSTOP
SUBSCRIBE_CAL	0x098		Subscribe configuration for task CAL
SUBSCRIBE_XOTUNE	0x09C		Subscribe configuration for task XOTUNE
SUBSCRIBE_XOTUNEABORT	0x0A0		Subscribe configuration for task XOTUNEABORT
SUBSCRIBE_XO24MSTART	0x0A4		Subscribe configuration for task XO24MSTART
SUBSCRIBE_XO24MSTOP	0x0A8		Subscribe configuration for task XO24MSTOP

Register	Offset	TZ	Description
EVENTS_XOSTARTED	0x100		Crystal oscillator has started
EVENTS_PLLSTARTED	0x104		PLL started
EVENTS_LFCLKSTARTED	0x108		LFCLK source started
EVENTS_DONE	0x10C		Calibration of LFRC oscillator complete event
EVENTS_XOTUNED	0x110		HFXO tuning is done. XOTUNED is generated after TASKS_XOSTART or after TASKS_XOTUNE has completed
EVENTS_XOTUNEERROR	0x114		HFXO quality issue detected, XOTUNE is needed
EVENTS_XOTUNEFAILED	0x118		HFXO tuning could not be completed
EVENTS_XO24MSTARTED	0x11C		XO24M started
PUBLISH_XOSTARTED	0x180		Publish configuration for event XOSTARTED
PUBLISH_PLLSTARTED	0x184		Publish configuration for event PLLSTARTED
PUBLISH_LFCLKSTARTED	0x188		Publish configuration for event LFCLKSTARTED
PUBLISH_DONE	0x18C		Publish configuration for event DONE
PUBLISH_XOTUNED	0x190		Publish configuration for event XOTUNED
PUBLISH_XOTUNEERROR	0x194		Publish configuration for event XOTUNEERROR
PUBLISH_XOTUNEFAILED	0x198		Publish configuration for event XOTUNEFAILED
PUBLISH_XO24MSTARTED	0x19C		Publish configuration for event XO24MSTARTED
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
XO.RUN	0x408		Indicates that XOSTART task was triggered
XO.STAT	0x40C		XO status
PLL.RUN	0x428		Indicates that PLLSTART task was triggered
PLL.STAT	0x42C		Which PLL settings were selected when triggering START task
LFCLK.SRC	0x440		Clock source for LFCLK
LFCLK.RUN	0x448		Indicates that LFCLKSTART task was triggered
LFCLK.STAT	0x44C		Copy of LFCLK.SRCCOPY register, set when LFCLKSTARTED event is triggered.
LFCLK.SRCCOPY	0x450		Copy of LFCLK.SRC register, set when LFCLKSTART task is triggered
PLL24M.RUN	0x468		Indicates that XO24MSTART task was triggered
PLL24M.STAT	0x46C		Which PLL settings were selected when triggering START task

5.4.3.1 TASKS_XOSTART

Address offset: 0x000

Start crystal oscillator (HFXO)

5.5 OSCILLATORS — Oscillator control

The system oscillators are automatically controlled by the clock control system, see [CLOCK — Clock control](#) on page 72.

The system has the following crystal oscillators:

- High-frequency 32 MHz crystal oscillator (HFXO)
- Low-frequency 32.768 kHz crystal oscillator (LFXO)

The crystal oscillators can be configured to use either internal or external capacitors.

5.5.1 High-frequency (32 MHz) crystal oscillator (HFXO)

The high-frequency crystal oscillator (HFXO) is controlled by a 32 MHz external crystal.

The crystal oscillator is designed for use with an AT-cut quartz crystal in parallel resonant mode and is connected between pins **XC1** and **XC2**. For correct oscillation frequency, the load capacitance must match the specification in the crystal datasheet. The following figure shows how the 32 MHz crystal is connected to the high frequency crystal oscillator.

Figure 13: Circuit diagram of the high-frequency crystal oscillator

The device can be used with external capacitors C1 and C2 or the internal capacitors C_{INT} , which are configurable.

For reliable operation, the crystal load capacitance, shunt capacitance, equivalent series resistance, and drive level must comply with the specifications in [table 32 MHz crystal oscillator \(HFXO\)](#) on page 1261. It is recommended to use a crystal with lower than maximum load capacitance and/or shunt capacitance. A low load capacitance reduces both start up time and current consumption.

When using internal capacitors, the load capacitance (CL) is the total capacitance seen by the crystal across its terminals and is calculated by the following equation.

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C_{INT} + C_{pcb1}$$

$$C2' = C_{INT} + C_{pcb2}$$

Figure 14: Load capacitance equation for internal capacitors

C_{INT} is the value of the internal capacitors. C_{pcb1} and C_{pcb2} are stray capacitance on the PCB.

The internal capacitor must be configured before starting the high-frequency crystal oscillator using the XOSTART task. To enable the internal capacitors, find the correct value for C_{INT} in the field `OSCILLATORS.XOSC32M.CONFIG.INTCAP` using the following equation.

$$INTCAP = ((CAPACITANCE - 5.5) * (FICR->XOSC32MTRIM.SLOPE + 791)) + FICR->XOSC32MTRIM.OFFSET * 4) / 256$$

The equation has the following variables:

- `CAPACITANCE` is the desired capacitor value of C_{INT} in pF, holding any value between 4.0 pF and 17.0 pF in 0.25 pF steps.
- `FICR->XOSC32MTRIM` are factory trim values which vary between devices.

After HFXO starts, the device uses the internal capacitor together with the external crystal after configuration.

5.5.1.1 Using external capacitors

It is possible to use external capacitors after disabling the internal capacitor.

When using external capacitors, the load capacitance (CL) is the total capacitance seen by the crystal across its terminals. It is calculated by the following equation.

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

Figure 15: Load capacitance equation for external capacitors

$C1$ and $C2$ are the external capacitors. C_{pcb1} and C_{pcb2} are stray capacitance on the PCB. C_{pin} is the pin input capacitance on pins **XC1** and **XC2**.

When using external capacitors, disable the internal capacitor by setting `OSCILLATORS.XOSC32M.CONFIG.INTCAP` to 0.

5.5.1.2 Crystal selection

Several crystals are supported by the 32 MHz crystal oscillator.

The following figure shows a simple model of a crystal. It has R-L-C series components, called equivalent series resistance (ESR), motional capacitance ($C_{0=N}$), and motional inductance (L_M). The capacitor in parallel, C_0 , is called the shunt capacitance, and models the package capacitance.

Figure 16: Simplified crystal model

The crystal needs to have parameters ESR , C_0 , and C_L selected to ensure the crystal oscillator is stable.

The following figure shows the maximum allowable combinations of ESR, C_0 and C_L for a given crystal. A crystal is supported if that crystal's parameters fall directly on the line or below it. Crystals that are above the line are not supported.

Figure 17: Maximum allowed combinations of ESR and C_0 for a given load capacitance C_L

5.5.2 Low-frequency (32.768 kHz) crystal oscillator (LFXO)

For clock accuracy higher than LFRC, the 32.768 kHz crystal oscillator (LFXO) must be used.

To use the LFXO, a 32.768 kHz crystal must be connected between the **XL1** and **XL2** pins, as shown in the following figure.

Figure 18: Circuit diagram of the low-frequency crystal oscillator

The device can be used with external capacitors C_1 and C_2 or the built-in configurable internal capacitors C_{INT} .

When using internal capacitors, the load capacitance (CL) is the total capacitance seen by the crystal across its terminals. It is calculated by the following equation.

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C_{INT} + C_{pcb1}$$

$$C2' = C_{INT} + C_{pcb2}$$

Figure 19: Load capacitance equation for internal capacitors

C_{INT} is the value of the internal capacitors. C_{pcb1} and C_{pcb2} are stray capacitance on the PCB.

The internal capacitors must be configured before starting the low-frequency crystal oscillator (LFXO). To enable the internal capacitors, determine the correct field for [OSCILLATORS.XOSC32KI.INTCAP](#) using the following equation.

```
INTCAP = round( (2*CAPACITANCE - 12) * (FICR->XOSC32KTRIM.SLOPE + 0.765625 * 512) / 512 +
FICR->XOSC32KTRIM.OFFSET / 64 )
```

The equation has the following variables:

- CAPACITANCE is the desired capacitor value in pF, holding any value between 3 pF and 18 pF in 0.65 pF steps.
- FICR->XOSC32KTRIM are factory trim values which are device specific.

When LFXO starts, it will use the internal capacitor together with the external crystal.

5.5.2.1 Using external capacitors

When using external capacitors, the load capacitance (CL) is the total capacitance seen by the crystal across its terminals. It is calculated by the following equation.

$$CL = \frac{(C1' \cdot C2')}{(C1' + C2')}$$

$$C1' = C1 + C_{pcb1} + C_{pin}$$

$$C2' = C2 + C_{pcb2} + C_{pin}$$

Figure 20: Load capacitance equation for external capacitors

C1 and C2 are ceramic SMD capacitors connected between each crystal terminal and ground. C_{pcb1} and C_{pcb2} are stray capacitance on the PCB. C_{pin} is the pin input capacitance on pins **XL1** and **XL2**. The load capacitors C1 and C2 must have the same value.

When using external capacitors, the internal capacitor is disabled by setting [OSCILLATORS.XOSC32KI.INTCAP](#) to 0.

5.5.2.2 External source

The 32.768 kHz crystal oscillator (LFXO) is designed to work with external sources.

The device can use a rail-to-rail clock, where the signal should be applied to the **XL1** pin with the **XL2** pin left unconnected or connected to GND. To enable rail-to-rail clock, set [XOSC32KI.BYPASS](#)=Enabled.

Using an external source requires that [CLOCK.LFCLK.SRC](#)=LFXO.

5.5.3 CPU clock frequency selection

The CPU clock frequency is configurable on boot in the register [PLL.FREQ \(Retained\)](#) on page 98.

The device supports 64 or 128 MHz frequency.

The device starts at 64 MHz. For higher frequencies, it must be configured when the CPU starts and before any peripherals that use the high-frequency clock are enabled. Changing the frequency on a running system or to an unsupported value causes undefined system behavior and the device can malfunction.

5.6 POWER — Power control

The POWER peripheral provides an interface for the power and clock subsystem for task, event, and interrupt related settings.

The POWER peripheral requests resources from the power and clock subsystem. The power and clock subsystem makes sure that the power mode with the proper latency settings is selected when requested. This means that the Constant Latency mode is prioritized over Low-power mode. For an overview of power modes, see [Sub-power modes](#) on page 69.

The event **POFWARN** is a system level event that enables the device to react quickly if there is a power failure. The power-fail comparator must be configured and enabled to receive the event, see [Power-fail comparator](#) on page 71 for more information.

Power control of the RAM blocks is controlled by the memory configuration peripheral (MEMCONF), see [MEMCONF — Memory configuration](#) on page 46.

Note: Registers **INTEN** on page 104, **INTENSET** on page 104, and **INTENCLR** on page 104 are shared between the POWER and CLOCK peripherals.

5.7 REGULATORS — Regulator control

The power supply consists of a number of LDO and DC/DC regulators that maximize the system's power efficiency.

All system components are powered from the main on-chip voltage regulator VREGMAIN. The regulator converts the voltage supplied on **VDD** to internal voltage.

The device also has an USB regulator, which only powers the USB physical interface. It will not power the device. The USB regulator is documented in [USBREG — USB regulator control](#) on page 114.

Figure 21: Regulator configuration

The main supply voltage is connected to the **VDD** pin.

5.7.1 VREGMAIN — Main regulator

VREGMAIN is the main regulator of the system.

The device only supports DC/DC mode, which needs external components. For details, see [Reference circuitry](#) on page 1246.

VREGMAIN starts up using a fall-back mode, and the DC/DC regulator must be enabled using register [VREGMAIN.DCDCEN](#) on page 108.

Inductor detection

The DC/DC regulator requires an external inductor connected to the **DCC** pin. If an inductor is not present, the regulator stays in fall-back mode to enable a soft shut-down of the system. Register **VREGMAIN.INDUCTORDET** on page 108 reports the inductor detection status and can be used to detect inductor failures that prevent DC/DC operation.

5.8 RESET — Reset control

A system-level reset is triggered by the following resets:

- Brownout
- Power-on
- CTRL-AP
- Watchdog
- Wakeup from System OFF
- Tamper detection
- Voltage glitch detection
- CPU Lockup
- Pin

The system reset sources are shown in the following figure.

Figure 22: Reset sources

After a reset, the device automatically starts up. The register [RESETREAS](#) on page 112 can be read to determine which source generated the reset.

5.8.1 Power-on reset

The power-on reset (POR) generator initializes the system when the supply voltage is above the power-on threshold.

The system is held in a reset state until the supply reaches the minimum operating voltage and the internal voltage regulators start. After a power-on reset, the device starts up.

5.8.2 Pin reset

A pin reset is generated when the physical reset pin on the device is asserted.

Pin reset is available on the reset pin **nRESET**, see [Pin assignments](#) on page 1219. The device starts after **nRESET** is deasserted.

The reset pin has an internal pull-up resistor with the same resistance as GPIO pull-ups, see [GPIO Electrical Specification](#) on page 1259.

CTRL-AP can also reset a pin, see [CTRL-AP resets](#) on page 110.

5.8.3 Brownout reset

The brownout reset (BOR) generator puts the system in RESET state if the supply voltage drops below the brownout reset threshold.

Similar to a power-on reset, the device starts after BOR is deasserted.

5.8.4 Glitch detector

The glitch detector (GLITCHDET) sets the system to the RESET state when the supply voltage or the device internal digital voltage drops below safe thresholds.

Similar to a power-on reset and a brownout reset, the device starts after GLITCHDET is deasserted.

For more information about the glitch detector, see [GLITCHDET — Voltage glitch detectors](#) on page 178.

5.8.5 Wakeup from System OFF mode reset

The device is reset when it wakes up from System OFF mode.

Similar to a power-on reset (POR), the device is started after waking up from System OFF.

If the device is in Debug interface mode, the debug access port (DAP) is not reset after a wakeup from System OFF mode. For more information, see [Debug and trace](#) on page 1174.

For details on the System OFF mode, see [System OFF mode](#) on page 70.

5.8.6 Soft reset

A soft reset is generated when the SYSRESETREQ bit of the application interrupt and reset control register (AIRCRR) in the Arm CPU is set. For more information, see [Arm documentation](#).

A soft reset can also be generated using CTRL-AP, see [CTRL-AP resets](#) on page 110.

Similar to a power-on reset (POR), the device is restarted after a soft reset.

5.8.7 CTRL-AP resets

CTRL-AP can generate the following resets.

- Soft reset
- Pin reset
- Hard reset. This is used during an Erase ALL operation and is less intrusive than Pin reset. For more details, see [Reset behavior](#) on page 111.

Through the debugger interface, CTRL-AP can generate three resets using register [RESET](#) on page 1187. For more details, see [CTRL-AP — Control access port](#) on page 1181.

Similar to a power-on reset (POR), the device is restarted after a CTRL-AP reset.

5.8.8 Watchdog timer reset

A watchdog timer (WDT) reset is generated when the watchdog timer times out.

Similar to a power-on reset (POR), the device is started after a watchdog reset.

5.8.9 Retained registers

A retained register is one that will retain its value in System OFF mode and through a reset, depending on the reset source. See the individual peripheral chapters for information on which of their registers are retained.

5.8.10 Reset behavior

The reset source determines the behavior of the device after a reset.

In System OFF mode, the watchdog timer is not running and CPU lockup is not possible. RAM may be fully or partially retained, depending on RAM retention settings in [MEMCONF — Memory configuration](#) on page 46.

If the device is in Debug Interface mode, the debug components are not reset. Additionally, CPU lockup does not generate a reset. See [Debug and trace](#) on page 1174 for more information about the different debug components in the system.

An 'x' in the table means that the specific module or register is reset. The table also explicitly lists which reset sources are commonly referred to as 'cold boot'.

Reset source	Cold boot	CM33	Peripherals	Debug	RAM	WDT	Retained registers				
							REGULATOR OSCILLATORS and CPU speed	RESET REAS	POWER GP-RET-REG	GPIO	GRTC. SYS-COUNTER
CPU lockup		x	x							x ¹	x
Soft reset and CTRL-AP soft reset		x	x							x ¹	
Wakeup from System Off mode		x	x			x		x			
CTRL-AP hard reset		x	x	x	x	x	x			x	x
CTRL-AP pin reset		x	x	x	x	x	x			x	x
Watchdog timer reset		x	x	x	x	x	x			x	x
Pin reset		x	x	x	x	x	x			x	x
TAMPC reset		x	x	x	x	x	x			x	x
GLITCHDET reset	x	x	x	x	x	x	x	x	x	x	x
Brownout reset	x	x	x	x	x	x	x	x	x	x	x
Power-on reset	x	x	x	x	x	x	x	x	x	x	x

Table 22: Reset overview

5.9 Power and clock components

5.9.1 USBREG — USB regulator control

A 5 V USB supply must power the VBUS pin when using the USB peripheral.

The device has a dedicated internal voltage regulator for converting the VBUS supply to 3.3 V for the USB signaling interface (D+ and D- lines, and pull-up on D+). The rest of the USB peripheral (USBHS) is supplied through the main supply like other on-chip features. As a consequence, both VBUS and VDD are required for USB peripheral operation. For details on the device voltage regulators, see [REGULATORS — Regulator control](#) on page 105.

6 Event system

The distributed programmable peripheral interconnect (DPPI) system enables peripherals to interact autonomously with each other through tasks and events, without intervention from the CPU.

The DPPI channels are local to each power domain, but can be transferred between power domains using PPI bridges.

The following figure shows the power domains, the PPI controllers (DPPIC), and the PPI bridges (PPIB).

Figure 23: Power domains and PPI bridges

A subset of PPI channels from a power domain can be bridged across to a different power domain. For example, PPIB00 can bridge a set number of configurable DPPI channels to PPIB10. For more details on how to configure the PPI and bridge system, see [DPPI — Distributed programmable peripheral interconnect](#) on page 119 and [PPIB — PPI Bridge](#) on page 128.

6.1 DPPI latencies

DPPI task and event latency depends on the power domain of the source and destination peripherals.

DPPI signals operate on the HCLKCORE, PCLK32M, and PCLK16M clocks.

Power domain	Clock source
MCU	HCLKCORE (64 or 128 MHz)
RADIO	PCLK32M (32 MHz)
PERI	PCLK16M (16 MHz)
LP	PCLK16M (16 MHz)

Table 23: DPPI clock frequency

For peripherals in the same power domain, there is a two cycle delay from when an event is generated until a task subscribing to the same channel is triggered. Events that are generated while the system

is sleeping will have additional access latency, as the system needs to request and provide sufficient resources for PPI handling. Examples of such events are the following:

- A GPIO toggling and generating an event through GPIOTE
- Events generated by GRTC while all other clocks are stopped

To improve PPI latency, the Constant Latency mode can be used, see [Sub-power modes](#) on page 69.

For peripherals in different power domains, additional access latency will apply. Events that are generated while the generating or receiving power domains are sleeping will have additional access latency, as the system needs to request and provide sufficient resources for PPI handling.

6.2 DPPI — Distributed programmable peripheral interconnect

The distributed programmable peripheral interconnect (DPPI) enables peripherals to interact autonomously with each other through tasks and events, without CPU intervention. DPPI allows precise synchronization between peripherals when real-time application constraints exist, and eliminates the need for CPU involvement to implement behavior which can be predefined using the DPPI.

Note: For more information on tasks, events, publish, subscribe, interrupts, and other concepts, see [Peripheral interface](#) on page 228.

The main features of DPPI are the following:

- Peripheral tasks can subscribe to channels
- Peripheral events can be published on channels
- Publish/subscribe pattern enabling multiple connection options that include the following:
 - One-to-one
 - One-to-many
 - Many-to-one
 - Many-to-many

The DPPI consists of several PPIBus modules. These modules are connected to a fixed number of DPPI channels and a DPPI controller (DPPIC).

Figure 24: DPPI overview

6.2.1 Channel publish and subscribe

The DPPI system directs peripheral events to a channel (publishing) and converts events from a channel into peripheral tasks (subscribing).

All peripherals include the following:

- One publish register per event
- One subscribe register per task

The publish and subscribe registers have two fields. A channel index field (CHIDX) determines which channel an event is published to, or which channel a task is subscribed to. In addition there is an ENABLE field that must be set to 1 to activate the operation.

Writing non-existing channel index (CHIDX) numbers into a peripheral's publish or subscribe registers will yield unexpected results.

One event can trigger multiple tasks by subscribing different tasks to the same channel. Similarly, one task can be triggered by multiple events by publishing different events to the same channel. For advanced use cases, multiple events and multiple tasks can connect to the same channel forming a many-to-many connection. If multiple events are published on the same channel at the same time, the events are merged and only one event is routed through the DPPI.

The following figure shows how peripheral events are routed onto different channels based on publish registers.

Figure 25: DPPI events flow

The following figure illustrates how peripheral tasks are triggered from different channels based on subscribe registers.

Figure 26: DPPI tasks flow

6.2.2 DPPI controller (DPPIC)

Enabling and disabling of DPPI channels is handled through DPPIC.

There are two ways of enabling or disabling a DPPI channel using DPPIC:

- Enable or disable channels individually using registers CHEN, CHENSET, and CHENCLR.
- Enable or disable channels in channel groups using the groups' tasks ENABLE and DISABLE. Channel groups should be defined via the CHG registers before these tasks are triggered.

Note: ENABLE tasks are prioritized over DISABLE tasks, i.e. in case of a simultaneously occurring TASKS_CHG[m].EN and TASKS_CHG[n].DIS (m and n can be equal or different), the CHG[m].EN task will be prioritized if the same channel subscribed to both groups.

DPPIC tasks (for example CHG[0].EN) can be triggered through DPPI like any other task, which means they can be linked to a DPPI channel through the subscribe registers.

In order to write to CHG[n], the corresponding CHG[n].EN and CHG[n].DIS subscribe registers must be disabled. Writes to CHG[n] are ignored if any of the two subscribe registers are enabled.

6.2.3 Connection examples

Several connection options are available with DPPI. Examples are given for how to create one-to-one and many-to-many connections.

One-to-one connection

This example shows how to create a one-to-one connection between the TIMER compare register and the SAADC start task.

The channel configuration is set up first. TIMER will publish its COMPARE0 event on channel 0, and SAADC will subscribe its START task to events on the same channel. When this is finished, the channel is enabled through the DPPIC.

```
NRF_TIMER20->PUBLISH_COMPARE[0] = (0 << TIMER_PUBLISH_COMPARE_CHIDX_Pos) |
    TIMER_PUBLISH_COMPARE_EN_Msk;
NRF_SAADC->SUBSCRIBE_START = (0 << SAADC_SUBSCRIBE_START_CHIDX_Pos) |
    SAADC_SUBSCRIBE_START_EN_Msk;
NRF_DPPIC20->CHENSET = DPPIC_CHENSET_CH0_Msk;
```

Many-to-many connection

The following example shows how to create a many-to-many connection, showcasing the DPPIC's channel group functionality.

A channel group that includes only channel 0 is set up first. Then the GPIOTE and TIMER configure their IN0 and COMPARE0 events respectively to be published on channel 0, while the SAADC configures its START task to subscribe to events on channel 0. Through DPPIC, the CHG0 DISABLE task is configured to subscribe to events on channel 0. After an event is received on channel 0 it will be disabled. Finally, channel 0 is enabled using the DPPIC task to enable a channel group.

```
NRF_DPPIC20->CHG[0] = (DPPIC_CHG_CH0_Included << DPPIC_CHG_CH0_Pos);
NRF_GPIOTE20->PUBLISH_IN[0] = (0 << GPIOTE_PUBLISH_IN_CHIDX_Pos) |
    GPIOTE_PUBLISH_IN_EN_Msk;
NRF_TIMER20->PUBLISH_COMPARE[0] = (0 << TIMER_PUBLISH_COMPARE_CHIDX_Pos) |
    TIMER_PUBLISH_COMPARE_EN_Msk;
NRF_SAADC->SUBSCRIBE_START = (0 << SAADC_SUBSCRIBE_START_CHIDX_Pos) |
    SAADC_SUBSCRIBE_START_EN_Msk;
NRF_DPPIC20->SUBSCRIBE_CHG[0].DIS = DPPIC_CHENSET_CH0_Msk | DPPIC_SUBSCRIBE_CHG_DIS_EN_Msk;
NRF_DPPIC20->TASK_CHG[0].EN = 1;
```

6.2.4 Special considerations for a system implementing TrustZone for Cortex-M processors

DPPI is implemented with split security in order to handle both secure and non-secure accesses. In a system implementing the TrustZone for Cortex-M technology, DPPI channels can be defined as secure or non-secure using the SPU.

A peripheral configured as non-secure can only subscribe to or publish on non-secure DPPI channels. A peripheral configured as secure can access all DPPI channels. DPPI handles both secure and non-secure accesses, but behaves differently depending on the access type.

- A non-secure peripheral access can only configure and control the DPPI channels defined as non-secure in the SPU.DPPI.PERM[n] register
- A secure peripheral access can control all the DPPI channels, independently of the SPU.DPPI.PERM[n] register

Non-secure access to a DPPI register or bit field controlling a channel marked as secure in a SPU.DPPI[n].PERM register is ignored. Write access has no effect, and read access returns a zero value.

Exceptions are not triggered when non-secure accesses target a register or a bit field controlling a secure channel. For example, if the bit i is set in the SPU.DPPI[0].PERM register (declaring DPPI channel [i] as secure), then the following is true:

- Non-secure write access to registers CHEN, CHENSET, and CHENCLR cannot write bit i of these registers
- Non-secure write access to registers TASK_CHG[j].EN and TASK_CHG[j].DIS is ignored if the channel group j contains at least one channel defined as secure (it can be the channel [i] itself or any channel declared as secure)
- Non-secure read access to registers CHEN, CHENSET, and CHENCLR always read 0 for the bit at position i

For the channel configuration registers (CHG[]), access from non-secure code is only possible if the included channels are all non-secure, whether the channels are enabled or not. If register CHG[g] included one or more secure channels, then the group g is considered as secure, and only secure transfers can read to or write from CHG[g]. A non-secure write access is ignored, and a non-secure read access returns 0.

The DPPI can subscribe to secure and non-secure channels through the SUBSCRIBE_CHG[] registers in order to trigger the task for enabling or disabling channel groups. An event from a secure channel is ignored if the group subscribing to this channel is non-secure. A secure group can subscribe to a non-secure channel or a secure channel.

Channel group

Creating a channel group allows all channels in that group to be simultaneously enabled or disabled. The security attribute for a channel group (secure or non-secure) is defined as follows:

- If all channels (enabled or not) within a group are non-secure, then the group is considered non-secure
- If at least one of the channels (enabled or not) within the group is secure, then the group is considered secure

6.2.5 Split security

Individual DPPI channels and channel groups can have independent security attributes.

The split security of DPPI means it handles both secure and non-secure code access. DPPI channels and channel groups can be defined as secure or non-secure.

For more information on DPPI security, see [DPPIC](#) on page 141.

6.3 PPIB — PPI Bridge

PPIB connects tasks and events of peripherals in two different PPI systems in different power-domains.

A PPI system contains a number of peripherals that can communicate with each other by using tasks and events. This functionality is enabled by the **DPPI** peripheral. In a PPI system, the peripherals and DPPI are instantiated in the same APB bus.

The following figure shows a PPI system including a PPIB:

Figure 27: PPI system with PPIB

PPIB uses tasks and events like a standard peripheral, and connects to local DPPI channels via PPIBus. For more information on PPIBus module, see **DPPI**.

PPIB has a number of channels. Each PPIB channel connects to a single DPPI channel.

6.3.1 PPIB connections

A PPIB channel in one PPI system can be connected to a PPIB channel in another PPI system forming a PPIB connection.

A channel belonging to a PPIB instance in a PPI system is connected to a channel belonging to a PPIB instance in a different PPI system, creating a one-to-one PPIB connection between the two PPI systems. The connections are fixed and point-to-point, that is, a channel in a PPIB instance is connected only to a specific channel in another PPIB instance. For information on how the channels in the different PPIB instances are connected, see the Configuration table under the Registers section.

A PPIB channel can be configured as either source or sink. When configuring one side of the PPIB connection as source, the other side of the PPIB connection must be configured as sink, and viceversa. PPIB connections are unidirectional. Configuring both sides of a connection as source and sink at the same time will yield unexpected results.

On the source side of a PPIB connection, in order to send a (local) peripheral event to a different PPI system, the corresponding PPIB channel is configured as a consumer, subscribing to the same DPPI channel as the (local) peripheral publishes to, using the **PPIB.SUBSCRIBE_SEND[n]** register, with n the PPIB channel number.

On the sink side of a PPIB connection, for a (local) peripheral to be able to receive this event, the corresponding PPIB channel is configured as a producer, publishing to the same DPPI channel as the (local) peripheral subscribes to, using the `PPIB.PUBLISH_RECEIVE[n]` register, with `n` the PPIB channel number.

In a PPI system, several peripherals can publish to the same DPPI channel on the source side of a PPIB connection. Similarly, several peripherals can subscribe to the same DPPI channel on the sink side of a PPIB connection. This allows multiple connection options between peripherals in different PPI systems, same as DPPI allows in a local PPI system: one-to-one, one-to-many, many-to-one and many-to-many. However, when multiple peripherals can publish to the same DPPI channel on the source side of a PPIB connection, there is a risk of overflow. See [Handshake and overflow](#) on page 129.

6.3.2 Handshake and overflow

The two PPIB instances in a PPIB connection need a handshake to transfer a peripheral event.

This is handled by a Handshake module in the PPIB. If a handshake fails because an earlier event has not been processed completely, the new event won't be sent. Instead, bit `i` in `OVERFLOW.SEND` register on the source side will be set, with `i` the corresponding PPIB channel number.

6.3.3 Connection examples

This section contains examples on how to connect two PPI systems using PPIB.

The following example shows how to create a PPIB connection between the TIMER10 compare event in the RADIO PD and the SAADC start task in PERI PD. PPIB11 in RADIO PD is hardwired to PPIB21 in PERI PD, which allows the PPI systems in the two separate power domains to connect. DPPI channel 0 is used by both power domains. Note that it is only necessary to use the same DPPI channel within the power domain; different DPPI channels can be used across power domains. An example of this is given further down in this section.

```
// RADIO PD
NRF_TIMER10->PUBLISH_COMPARE[0] = (0<<TIMER_PUBLISH_COMPARE_CHIDX_Pos) |
TIMER_PUBLISH_COMPARE_EN_Msk;
NRF_PPIB11->SUBSCRIBE_SEND[0] = (0<<PPIB_SUBSCRIBE_SEND_CHIDX_Pos) |
PPIB_SUBSCRIBE_SEND_EN_Msk;
NRF_DPPIC10->CHENSET = DPPIC_CHENSET_CH0_Msk;

// PERI PD
NRF_SAADC->SUBSCRIBE_START = (0<<SAADC_SUBSCRIBE_START_CHIDX_Pos) |
SAADC_SUBSCRIBE_START_EN_Msk;
NRF_PPIB21->PUBLISH_RECEIVE[0] = (0<<PPIB_PUBLISH_RECEIVE_CHIDX_Pos) |
PPIB_PUBLISH_RECEIVE_EN_Msk;
NRF_DPPIC20->CHENSET = DPPIC_CHENSET_CH0_Msk;
```

The following example shows how to create a PPIB connection between the TIMER10 compare event in the RADIO PD and the GPIOTE SET task in LP PD. The two PPI systems must be connected through PPIB instances PPIB21 and PPIB22 in PERI PD. These PPIB instances are not connected to any peripheral, only to the PPIB instances in RADIO and LP power domains. PERI PD acts as a central system that connects the two systems by means of local PPIB and DPPIC instances. This allows scaling to larger PPI systems, since multiple PPI systems can be interconnected through a central PPI system. DPPI channel 0 is used for internal RADIO PD connections, channel 1 is used by LP PD, and channel 5 is used by PERI PD. It is

important that same DPPI channels are used within a power domain, but across domains the DPPI channel number does not matter.

```
// RADIO PD
NRF_TIMER10->PUBLISH_COMPARE[0] = (0<<TIMER_PUBLISH_COMPARE_CHIDX_Pos) |
TIMER_PUBLISH_COMPARE_EN_Msk;
NRF_PPIB11->SUBSCRIBE_SEND[0] = (0<<PPIB_SUBSCRIBE_SEND_CHIDX_Pos) |
PPIB_SUBSCRIBE_SEND_EN_Msk;
NRF_DPPIC10->CHENSET = DPPIC_CHENSET_CH0_Msk;

// LP PD
NRF_GPIOTE30->SUBSCRIBE_START = (1<<GPIOTE_SUBSCRIBE_SET_CHIDX_Pos) |
GPIOTE_SUBSCRIBE_SET_EN_Msk;
NRF_PPIB30->PUBLISH_RECEIVE[0] = (1<<PPIB_PUBLISH_RECEIVE_CHIDX_Pos) |
PPIB_PUBLISH_RECEIVE_EN_Msk;
NRF_DPPIC30->CHENSET = DPPIC_CHENSET_CH1_Msk;

// PERI PD
NRF_PPIB21->PUBLISH_RECEIVE[0] = (5<<PPIB_PUBLISH_RECEIVE_CHIDX_Pos) |
PPIB_PUBLISH_RECEIVE_EN_Msk;
NRF_PPIB22->SUBSCRIBE_SEND[0] = (5<<PPIB_SUBSCRIBE_SEND_CHIDX_Pos) |
PPIB_SUBSCRIBE_SEND_EN_Msk;
NRF_DPPIC20->CHENSET = DPPIC_CHENSET_CH5_Msk;
```

6.3.4.1 Security

The PPIB channels are security agnostic.

When configuring PPIB channels, consider whether the DPPI channel security settings need to match on both ends of the PPIB connection. While the PPIB channels themselves are security agnostic, maintaining consistent security configuration of the DPPI channels may be necessary.

6.3.5 Registers

7 Security

The device is designed with state-of-the-art security features that include the following.

- Arm TrustZone for memory, peripherals, GPIO pins, PPI channels, and interrupts
- Tamper controller to monitor and prevent physical attacks
 - Active driven tamper switches (active shield)
 - Signal protectors for critical configuration signals
 - Glitch detectors to guard against fault injection attacks
- Crypto accelerator with built-in self-check and countermeasures
 - Masking against simple and differential power analysis
 - Protection against timing attacks
- NIST SP 800-90B random number generator
- Non-volatile memory controller with built-in secure key storage (key management unit)
- Immutable boot region for establishing root of trust
- Authenticated debug to prevent unauthorized access to the debug port

7.1 Memory and peripheral access permissions

Access permissions are controlled by TrustZone, MPC, and SPU security peripherals.

The following figure shows the system security control modules for memory, peripherals, GPIO, and PPI.

Figure 28: Modules filtering access permissions

The Arm Cortex-M33 CPU enforces TrustZone security internally, before issuing bus transactions. For security checks internal to the Arm Cortex-M33, see [TrustZone security](#) on page 136. After the internal CPU security check, the transaction is available on the bus.

Secure and non-secure memory has to be configured in the SAU and MPC.

The security attribution of a bus transaction from the Arm Cortex-M33 is determined by the CPU, SAU, and IDAU settings. See [TrustZone security](#) on page 136 for more information.

For RISC-V and peripherals, the attribution of the bus transaction is determined by the [SPU](#) settings.

The destination's security attribute is a combination of [MPC](#) and [SPU](#) configurations.

Abbreviation	Description
NS	Non-secure – TrustZone security attribute is non-secure
S	Secure – TrustZone security attribute is secure
NSC	Non-secure callable – TrustZone security attribute is non-secure callable
IDAU	Arm implementation defined attribution unit
SAU	Arm security attribution unit
SPU	Nordic system protection unit
MPC	Nordic memory privilege controller

Table 24: Abbreviations

Memory access overview

The following table lists the security attributes of the bus manager and their access to memory configured as secure and non-secure.

Bus manager security attribute	Destination memory security attribute	Access successful	MPC bus fault and error event
S	S	Yes	No
NS	S	No	Yes
S	NS	Yes	No
NS	NS	Yes	No

Table 25: Memory access overview

Peripheral access overview

Peripherals are moved in the memory map based on their security association. Non-secure peripherals can be accessed through addresses starting with 0x4 while secure peripherals are accessible in the memory region starting with 0x5.

The security association of each peripheral is controlled via the SPU. Only peripherals with programmable security association can be moved in the memory map.

Bus manager security attribute	Destination memory security attribute	Address region	Access successful	SPU bus fault and error event
S	S	0x5	Yes	No
S	S	0x4	No	Yes
NS	S	0x5	No	Yes
NS	S	0x4	No	Yes
S	NS	0x5	No	Yes
S	NS	0x4	Yes	No
NS	NS	0x5	No	Yes
NS	NS	0x4	Yes	No

Table 26: Peripheral access overview

In addition, the following also applies:

- For split security peripherals, bus faults are not generated for blocked split security bit accesses. Reads as 0, write is ignored.
- In a split peripheral, access is blocked to secure registers using the non-secure 0x4 memory region because it is through non-secure transactions. Make sure to use the secure memory region to access secure registers.

7.2 TrustZone security

The security architecture is based on Arm TrustZone.

The Arm Cortex-M based CPU supports Arm TrustZone for secure, non-secure, and non-secure callable memory regions.

The security attribution unit (SAU) and implementation defined attribution unit (IDAU) define the access permissions based on the security state.

The IDAU configuration divides system memory space into secure (S) and non-secure (NS) regions. The SAU provides configurable regions for the Arm Cortex-M CPU, and is used to define non-secure callable (NSC) regions.

IDAU preset configuration

IDAU configuration is preset in hardware and is not available for user configuration. The security attribution follows the address map, and the peripheral memory space is aliased for the secure and non-secure memory state, as defined in the following table.

Memory map name	Address map	IDAU TrustZone security attribute
Private peripheral bus	0xE0000000 – 0xFFFFFFFF	Not applicable
Device memory	0xA0000000 – 0xDFFFFFFF	NS
External memory	0x60000000 – 0xAFFFFFFF	NS
Peripheral (secure)	0x50000000 – 0x5FFFFFFF	S
Peripheral (non-secure)	0x40000000 – 0x4FFFFFFF	NS
Data memory	0x20000000 – 0x3FFFFFFF	NS
Program memory	0x00000000 – 0x1FFFFFFF	NS

Table 27: IDAU configuration

SAU configuration

The Arm Cortex-M33 CPU must configure its SAU regions when the CPU starts. The CPU assumes the memory map is secure before configuring the SAU regions.

SAU configuration registers are documented in the *Arm Cortex-M33 Technical Reference Manual*.

TrustZone security attributes

Based on IDAU and SAU configuration, the following table shows the TrustZone security attribute results.

IDAU security attribute	SAU security attribute	Security attribute result
S	NS, NSC, or S	S
NS, NSC, or S	S	S
NS	NS	NS
NS	NSC	NSC

Table 28: TrustZone security attributes

For the memory region that contains the secure gateway instruction branch veneers (entry points), the TrustZone security attribute seen by the Arm Cortex-M must be NSC for the secure functions that are callable from a non-secure program.

Example memory map

The following figure shows an example memory map using SAU regions to provide NS, S, and NSC regions. The figure also includes the required MPC override configuration to ensure correct secure/non-secure system partitioning.

Figure 29: Example memory map security attribution

TrustZone security access

The Arm Cortex-M TrustZone security module generates a CPU SecureFault exception when access is not allowed. The following table shows combinations of TrustZone security attributes.

Arm Cortex-M TrustZone security attribute	Destination address security attribute	Secure fault	Access allowed
S	S	No	Yes
S	NS	No	Yes
NS	NS	No	Yes
NS	S	Yes	No

Table 29: TrustZone security access

The first two columns show the TrustZone security attribute from the [TrustZone security attributes](#) table.

The Arm Cortex-M TrustZone security attribute is the TrustZone security attribute seen by the Arm Cortex-M CPU while executing a program. This shows if the Arm Cortex-M CPU program is executed from S, NS, or NSC memory. The NSC for the Arm Cortex-M TrustZone security attribute behaves same as S in the table.

The destination address security attribute is the TrustZone security attribute of the destination address lookup from the SAU and IDAU. It is used by the Arm Cortex-M CPU on the bus transaction.

7.3 Immutable boot region

The device RRAM has a boot region that can be made immutable before the CPU starts up.

Boot initiated from an immutable source allows later boot steps to be performed by authenticated code.

The boot region starts at address `0x00000000`. This address contains the initial secure program counter (PC), the stack pointer (SP), and the interrupt vectors. The size and permissions of the region are configured using UICR register [BOOTCONF](#) on page 66.

After configuration, when there is a device reset, the hardware state-machine reads UICR fields and configures [RRAMC](#). This enforces boot region protection before the Arm Cortex-M33 is released from reset.

For more information about the immutable boot region, see [RRAMC — Resistive random access memory controller](#) on page 48.

7.4 Security attributes

Bus access can have secure or non-secure attribution which follows the transaction through the system.

Non-secure peripherals use non-secure DMA bus transactions. Secure peripherals have configurable DMA security and can generate either secure or non-secure DMA bus transactions. The peripheral security is configured using [SPU — System protection unit](#) on page 195.

For Arm Cortex CPUs, see the Arm TrustZone architecture document for more details on security.

7.5 Security fault

Memory accesses that violate security permissions will generate a security fault.

If the Arm Cortex-M processor accesses RAM or NVM memory that violate security permissions, and the SAU regions match the device secure/non-secure memory map, the processor generates a SecureFault exception before the transaction enters the system busses.

At the system level, bus accesses are filtered by the Memory Protection Controller (MPC) and System Protection Unit (SPU) security components. These components trigger a BusFault using bus error response, not a SecureFault.

Access to a peripheral register that violates security permissions triggers the SPU event [PERIPHACCERR](#). For more information about the SPU, see [SPU — System protection unit](#) on page 195. See also [Peripherals with split security access](#) on page 140.

If a peripheral DMA controller, or the the coprocessor, attempts to access a memory region that is not allowed by the MPC, the MPC will generate a bus error response that triggers a BusFault. The MPC also generates the [MEMACCERR](#) event. For more information, see [MPC — Memory Privilege Controller](#) on page 189.

7.6 Peripherals with split security access

Some peripherals have split security access, meaning they can handle both secure and non-secure access. A subset of the peripheral's functions can be secure, while another subset is non-secure. The security is configured using SPU registers.

The peripheral instantiation table in [Instantiation](#) on page 232 details the peripherals with split access.

Split security access is handled either on the register level or on the bit level, as explained in the following sections.

Register level split security access

For this group of peripherals, security is enforced at the register level. Split security settings apply for the entire register. Illegal access to the register will trigger a security fault. For example, if a register is configured as secure and the register is accessed from non-secure code, a security fault with a bus fault will be generated. A security fault due to an illegal access triggers the SPU event [PERIPHACCERR](#).

Bit level split security access

For this group of peripherals, security is enforced at the register bit level. Split security settings are applied to individual bits of the register. The register supports access from both secure and non-secure code.

No exceptions are triggered for the access, however the following apply:

- Writing a secure bit from non-secure code will have no effect
- Reading a register from non-secure code will return 0 for all bits that are secure

For example, if bit *i* is configured as secure, then the following apply:

- Non-secure write access to the register will not change bit *i*
- Non-secure read access to the register will read 0 for the bit at position *i*

Interrupts

Some peripherals have split security interrupts. This means the interrupt can be configured with a security attribute.

An interrupt may be generated during secure or non-secure execution, and the interrupt handler is executed based on the interrupt's security attribute.

Interrupts implement split security at the register level. For instance, if interrupt 0 is configured as secure and there is a non-secure read/write access to registers INTEN0, INTENSET0, INTENCLR0, or INTPEND0, a security fault with a bus fault will be generated.

Interrupts are generated when enabled events are triggered. When an event for a split security interrupt is triggered, the following applies.

- If an interrupt is configured as secure, an event associated to either a secure or non-secure feature can trigger the interrupt.
- If an interrupt is configured as non-secure, only events associated with non-secure features can trigger the interrupt.

An attempt to enable an interrupt for an event that does not match the ownership and security settings of the interrupt will be ignored and a security fault is not generated.

A non-secure event can be enabled to trigger a secure interrupt.

7.6.1 CRACEN

CRACEN protects the Protected RAM and the SEED register from being accessed by the CPU.

Only KMU is able to push assets to the Protected RAM and the SEED register. The CPU does not have access to these. The hardware has built in protection that does not need configuration.

7.6.2 DPPIC

Individual DPPI channels and channel groups can have independent security attributes that are defined as either secure or non-secure. DPPI supports split security, handling both secure and non-secure access.

DPPI channels

A peripheral configured as non-secure can only subscribe to or publish on non-secure DPPI channels. A peripheral configured as secure can access all DPPI channels. An attempt by a non-secure peripheral to subscribe to or publish on a DPPI channel configured as secure is ignored, and a PPI event is not issued.

DPPI channels are enabled or disabled through individual bits in registers CHEN, CHENSET, and CHENCLR.

The security of a DPPI channel is configured using [FEATURE.DPPIC.CH\[n\] \(n=0..23\)](#) on page 202.

DPPI channel groups

Channels can be grouped, which allows them to be enabled or disabled collectively.

A channel group is either secure or non-secure.

- Secure channel group – includes both secure and non-secure DPPI channels
- Non-secure channel group – only includes non-secure DPPI channels

An attempt to include a secure DPPI channel in a non-secure DPPI channel group is ignored.

Registers CHG[n], TASKS_CHG[n].EN, TASKS_CHG[n].DIS, SUBSCRIBE_CHG[n].EN, and SUBSCRIBE_CHG[n].DIS configure the DPPI channel groups. A security fault is triggered when an illegal access is made to these registers.

DPPIC subscribe to DPPIC channels through the SUBSCRIBE_CHG[] registers to trigger the task for enabling or disabling channel groups. An event from a secure channel is ignored if the group subscribing to that channel is non-secure. A secure group can subscribe to a non-secure channel or a secure channel.

The security of a DPPIC channel group is configured using [FEATURE.DPPIC.CHG\[n\] \(n=0..7\)](#) on page 203.

7.6.3 GPIO

GPIO pins can be either secure or non-secure.

GPIO supports split security, meaning the GPIO pins and registers can be accessed from both secure and non-secure peripherals.

A peripheral configured as non-secure can only access non-secure pins. A peripheral configured as secure will be able to access all pins. An attempt to access a pin configured as secure by a non-secure peripheral is ignored.

GPIO pins can be read and written through individual bits in the GPIO port registers OUT, OUTSET, OUTCLR, and IN. GPIO pin direction is configured individually using bits in registers DIR, DIRSET, and DIRCLR. An attempt to access bits with a different security setting is ignored. Writing to these bits will have no effect, and read access returns a zero value.

The LATCH register has split security. Non-secure code can only read the state of the non-secure pins, while the secure pins read as zero. Secure code is able to read the state of all pins.

The DETECTMODE register applies to the entire port (both secure and non-secure pins), and determines if the latched or non-latched signals will generate the DETECT signal.

Pin security configuration

Access to device pins can be controlled by SPU. A pin can be set as secure so that only secure peripherals or secure code can access it. Pins set as non-secure can be accessed by both secure and non-secure peripherals or code.

The security attribute of each pin can be individually configured in [FEATURE.GPIO\[n\].PIN\[o\]](#) ($n=0..3$) ($o=0..31$) on page 204. When the secure attribute (SECATTR) is set for a pin, only peripherals that have the secure attribute set will be able to read the value of the pin or change it.

Peripherals can select the pins they need access to through their PSEL registers. If a peripheral has its attribute set to non-secure, but one of its PSEL registers selects a pin with the attribute set to secure, the SPU controlled logic will ensure that the pin selection is not propagated. In addition, the pin value will always be read as zero to prevent a non-secure peripheral from obtaining a value from a secure pin. Access to other pins with the attribute set as non-secure will not be blocked.

Pins can also be dedicated to peripherals by using the CTRLSEL field in the GPIO PIN_CNF[n] register. For pins controlled using CTRLSEL, the SPU PIN security setting is bypassed and pin access is controlled by the peripheral. This is illustrated in the following figure.

Figure 30: Pin access using CTRLSEL

7.6.4 GPIOTE

Individual GPIOTE channels and interrupts can have independent security settings and are defined as secure or non-secure.

GPIOTE channels

GPIOTE channel security is configured using [FEATURE.GPIOTE\[n\].CH\[o\] \(n=0..1\) \(o=0..7\)](#) on page 203.

A GPIOTE channel configured as secure can only be used by secure code to send tasks and receive events. A GPIOTE channel configured as non-secure can be used by both secure and non-secure code to send tasks and receive events.

GPIOTE channel tasks and events can be configured with a specific GPIO pin.

- A secure GPIOTE channel can be configured with both secure and non-secure GPIO pins
- A non-secure GPIOTE channel can only be configured with non-secure GPIO pins

See CONFIG[n].PSEL and CONFIG[n].PORT registers for more information.

GPIOTE channels that are not configured as described will not write to the pin when triggering the SET[n], CLR[n], and OUT[n] tasks, and will not generate the IN[n] event with changes in the pin polarity.

A GPIOTE channel *n* configured as secure has the following properties only during secure code execution:

- Trigger SET[n], CLR[n], and OUT[n] tasks
- Generate IN[n] events
- Access to the corresponding CONFIG[n] register

A GPIOTE channel *n* configured as non-secure has the following properties during both secure and non-secure code execution:

- Trigger SET[n], CLR[n], and OUT[n] tasks
- Generate IN[n] events
- Access to the corresponding CONFIG[n] register

A security fault is triggered when there is an access violation when accessing registers TASKS_SET[n], TASKS_CLR[n], TASKS_OUT[n], EVENTS_IN[n], or CONFIG[n].

GPIOTE channels can connect to PPI channels in order to send and receive events from other peripherals. GPIOTE channels can only publish or subscribe from DPPI channels that have the correct security attribute. An attempt to subscribe or publish on a DPPI channel configured as secure by a non-secure GPIOTE channel is ignored. A secure GPIOTE channel can subscribe or publish to both secure and non-secure DPPI channels.

GPIOTE interrupts

The security of the GPIOTE interrupt is configured using [FEATURE.GPIOTE\[n\].INTERRUPT\[o\] \(n=0..1\) \(o=0..7\)](#) on page 203.

A secure fault is triggered when non-secure code attempts to access registers INTENSET/INTENCLR on a secure GPIOTE interrupt.

GPIOTE interrupt *i* can only be generated by IN[j] event if interrupt *i* and channel *j* have the correct security attribute.

A secure GPIOTE interrupt can be triggered by an event generated by a secure and non-secure GPIOTE channel.

A non-secure GPIOTE interrupt can only be triggered by an event generated by non-secure GPIOTE channel.

7.6.5 GRTC

GRTC is implemented with split security, meaning it handles access from both secure and non-secure code. Individual **GRTC** SYSCOUNTER compare/capture channels and interrupts can have independent security settings that define them as secure or non-secure.

SYSCOUNTER compare/capture channels

The SYSCOUNTER compare/capture channels have the following security:

- **Secure** — The channel and its associated registers, trigger/subscribe tasks, and receive/publish events can only be accessed by secure code.
- **Non-secure** — The channel and its associated registers, trigger/subscribe tasks, and receive/publish events can be accessed by secure and non-secure code.

GRTC interrupts

GRTC interrupts can be defined as secure or non-secure.

A security fault is triggered when an invalid access targets registers INTEN/INTENSET/INTENCLR/INTPEND associated with an **GRTC** interrupt.

GRTC interrupt can only be generated by a COMPARE[j] event if the interrupt and channel have the correct security attribute.

A secure GRTC interrupt can be triggered by a secure or non-secure GRTC channel.

A non-secure GRTC interrupt can be triggered by an event generated by non-secure GRTC channel. An event generated by secure GRTC channel cannot trigger the interrupt.

7.7 Physical security

The device has countermeasures for physical attacks. It can detect and report fault injection attacks such as voltage glitching or electromagnetic fault injection.

The external active shield I/O interface is provided to facilitate PCB and product level security. It can detect if a product's encapsulation has been opened, or if the product has been tampered with. For more information, see [TAMPC — Tamper controller](#) on page 206.

The crypto accelerator (CRACEN) peripheral is protected against differential power analysis (DPA) attacks. The AES and public key acceleration engines all have countermeasures against DPA attacks and will report attack attempts. For more information, see [CRACEN — Cryptographic accelerator engine](#) on page 144.

7.8 Security components

7.8.1 CRACEN — Cryptographic accelerator engine

CRACEN (Cryptographic accelerator engine) is a dedicated hardware peripheral that provides a comprehensive set of cryptographic primitives and services to accelerate and harden cryptographic operations on the device.

CRACEN integrates symmetric ciphers, authenticated encryption, public-key arithmetic engines, and high-quality random number generation. It also includes an isolated key generator (IKG) to provision and hold keys securely, reducing exposure of sensitive material to the host CPU and software.

CRACEN is intended to offload compute-intensive and security-sensitive tasks from the main processor: encrypting and decrypting data, computing digests and message authentication codes, performing signature generation and verification, and carrying out key-exchange protocols such as Diffie-Hellman.

The main features of the CRACEN peripheral are the following:

- AES – supports 128- and 256- bit keys, but excludes multi-part operations . Up to 1 MB operation size for AES-CCM and AES-CTR.
- Chacha20-Poly1305, but without multi-part operations
- SHA – SHA1, SHA3, SHA-224, SHA-256, SHA-384, SHA-512
- Public key cryptographic engine (PKE)
 - Modular exponentiation – RSA with 4096-bit maximum operand size
 - Elliptic curve cryptography (ECC) with 640-bit maximum operand size
 - Digital signature algorithm (DSA) and Elliptic curve digital signature algorithm (ECDSA), with 4096-bit maximum operand size
 - Diffie-Hellman (D-H and ECD-H) key exchange
- Random number generators (RNG) – NDRNG, including TRNG
- Deterministic random bit generator (DRBG)
- Isolated key generator (IKG) – One asymmetric key and two symmetric (AES) keys
- Counter measures against side channel analysis for PKE and AES

Figure 31: Cryptographic accelerator engine block diagram

7.8.1.1 Disclaimer

This section contains an important disclaimer about the CRACEN peripheral documentation.

CRACEN is recommended for use with the libraries in Nordic Semiconductor device SDKs. These libraries are tested and verified to work with the CRACEN hardware. The CRACEN subsystem documentation and register descriptions are for reference only and can be used for modifying the Nordic supplied SDK libraries or implementing new features.

Nordic Semiconductor ASA reserves the right to change the CRACEN documentation and register descriptions without further notice. Changes will not trigger erratas and will not be seen as changing form/fit/function of the device.

Please note that Nordic cannot support questions directly related to the register interface or modification of the source code implementation. Nordic provide support for the top-level API in the software library distributed as part of the device SDK.

7.8.1.2 Initialization

The CRACEN peripheral is a hardware and software solution where software is delivered as libraries in Nordic device SDKs. Recommended usage of the CRACEN subsystem is to use the SDK library implementation available for the device. The CRACEN subsystem is documented for reference purpose only, please see section [Disclaimer](#) on page 145 for more information.

Before the CRACEN peripheral can be used, it must be configured.

CRACEN is enabled using the [ENABLE](#) register. When CRACEN is enabled, it will erase the PKE data RAM by starting a zeroization process. When the PKBUSY field of the [PK.STATUS](#) is cleared, the zeroization operation is complete. The PKE engine is not available until the zeroization process has finished.

After CRACEN has been enabled, the CRACENCORE registers can be used.

Each hardware crypto operation category (module) must then be individually enabled. Note that ongoing crypto operations will complete even if the module is disabled during the operation.

7.8.1.3 PKE data RAM

The PKE data RAM is used by CRACEN as a store for intermediate values when doing cryptographic operations.

The PKE data RAM is divided into 15 different pages of size 4096 bits, where each page holds different data types for asymmetric cryptographic operations. After CRACEN IKG has been started, the PKE operate in what is referred to as CRACEN Secure Mode. In CRACEN Secure Mode, PKE RAM pages 0x8 - 0xC are accessible to the CPU, and will hold both the IAK public key components and the digest to be signed in addition to the signature components. The following table lists all pages and their availability from CPU access in CRACEN Secure Mode. To avoid information leakage, some of the pages are automatically zeroized when CRACEN is exiting Secure Mode.

Page number	Access	Zeroization
0-7	Blocked from CPU access	Yes
8-12	Accessible from the CPU	No
13-15	Blocked from CPU access	Yes

Table 30: PKE RAM page availability in CRACEN Secure Mode

7.8.1.4 Protected RAM

Protected RAM regions can be retained and locked for storing symmetric keys. The CPU cannot access these regions.

After KMU has pushed keys into the protected RAM, **PROTECTEDDRAMLOCK** must be set to `Enabled` before CRACEN can access and use the keys.

Register **PROTECTEDDRAMLOCK** is a write-once register, and cannot be changed until the next device reset.

The address range of the Protected RAM memory range is defined in **Memory** on page 13.

7.8.1.5 Countermeasures

CRACEN contains security countermeasures to prevent malicious usage.

The following engines implement countermeasures:

- AES – Masking against Simple Power Analysis (SPA) and Differential Power Analysis (DPA)
- IKG/PKE – Protection against timing attacks and DPA

If CRACEN IKG/PKE is used maliciously, a **TAMPC** event will be generated and countermeasures executed according to the **TAMPC** configuration. The bits in **TAMPC** that control the countermeasures have lock bits, preventing further modification to the configuration.

7.8.1.6 Isolated Key Generator

The Isolated Key Generator (IKG) is a module that derives symmetric and asymmetric keys from the unique seed and optional personalization string.

After IKG has been enabled, CRACEN performs an IKG health test. The **CTRDRBGBUSY** field of the **IKG.STATUS** is cleared when the operation has completed. IKG is started by writing to the **IKG.START** register. The generated IKG keys are valid as long as CRACEN remains enabled. For details on enabling and disabling CRACEN, see **ENABLE** on page 151.

The IKG derives the following keys from seed upon request:

- One 256-bit ECC P-256 key
- Two 256-bit AES keys

Note: The IKG generated keys are not directly accessible to the CPU but are used by the PKE and AES engines. The IKG generated AES keys are not the same as protected keys in protected RAM, but can be used by the same AES engine.

7.8.1.6.1 Loading seed to IKG

Before keys can be generated, **KMU** must push the key generation seed used by the IKG to the **SEED** register and marked as valid.

To create and derive a seed the following sequence of operations are needed.

Create device unique seed

1. Create three 128-bit random numbers using CRACEN RNG.
2. Provision the random numbers to KMU slots 0, 1, and 2 (128 bits in each slot).
 - a. **SRC.DEST**=**CRACEN.SEED**[n], where n=0, 4, and 8
 - b. **SRC.VALUE**=**random**[i], where i=0,1, and 2 (random number results from **CRACEN.RND** operation in step 1)

Load seed from KMU to CRACEN

1. Push the KMU slots where the seed is stored (KMU slots 0, 1, and 2).
2. Once all **SEED** registers have been pushed, CRACEN locks the **SEED** register and validates the seed for the IKG.

Note: Any IKG key generations without valid seed (**CRACEN.SEEDVALID**) will fail.

7.8.1.7 Low power

To ensure lowest possible power consumption when the peripheral is not needed, disable CRACEN.

Make sure any operations are finished before disabling the peripheral in register [ENABLE](#).

7.8.1.8 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
CRACEN	GLOBAL	0x50059000	HF	S	NSA	No	Crypto accelerator

Configuration

Instance	Domain	Configuration
CRACEN	GLOBAL	Access to CRACEN registers is blocked while KMU is performing a PUSH operation. CRACEN cannot write RRAM. CRACEN CRYPTOACCELERATOR specific configuration registers included PKE data (address 0x50018000) must be read and written using aligned access, i.e. using an operation where a word-aligned address is used for a word, or a halfword-aligned address is used for a halfword access. PKE code (address 0x5001C000) must be accessed using aligned access, i.e. using an operation where a word-aligned address is used for a word, or a halfword-aligned address is used for a halfword access.

Register overview

Register	Offset	TZ	Description
EVENTS_CRYPTOMASTER	0x100		Event indicating that interrupt triggered at Cryptomaster
EVENTS_RNG	0x104		Event indicating that interrupt triggered at RNG
EVENTS_PKEIKG	0x108		Event indicating that interrupt triggered at PKE or IKG
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
ENABLE	0x400		Enable CRACEN peripheral modules.
SEEDVALID	0x404		Indicates the SEED register is valid. Writing this register has no effect.
SEED[n]	0x410		Seed word [n] for symmetric and asymmetric key generation. This register is only writable from KMU.
SEEDLOCK	0x440		Indicates the access to the SEED register is locked. Writing this register has no effect.
PROTECTEDDRAMLOCK	0x444		Lock the access to the protected RAM.

7.8.1.8.1 EVENTS_CRYPTOMASTER

Address offset: 0x100

Event indicating that interrupt triggered at Cryptomaster

The interrupt source must be cleared at Cryptomaster before clearing this event.

7.8.1.8.9 SEEDVALID

Address offset: 0x404

Indicates the **SEED** register is valid. Writing this register has no effect.

This register is set when all **SEED** registers have been written, and the SEED is now valid.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A																															
Reset 0x00000000				0 0

A	RW	VALID			Marks the SEED as valid																														
			Disabled	0	Valid disabled.																														
			Enabled	1	Valid enabled.																														

7.8.1.8.10 SEED[n] (n=0..11)

Address offset: 0x410 + (n × 0x4)

Seed word [n] for symmetric and asymmetric key generation.

This register is only writable from KMU.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value								Description																							
A	W	VAL										Seed value																							

7.8.1.8.11 SEEDLOCK

Address offset: 0x440

Indicates the access to the **SEED** register is locked. Writing this register has no effect.

This register is set when all **SEED** registers have been written, and the SEED is now locked.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID				A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	RW	ENABLE						Enable the lock																											
								Only possible to write a value 1.																											
			Disabled	0				Lock disabled.																											
			Enabled	1				Lock enabled.																											

7.8.1.8.12 PROTECTEDRAMLOCK

Address offset: 0x444

Lock the access to the protected RAM.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

CRYPTMSTRDMA registers included CRYPTMSTRHW registers included RNGCONTROL registers included PK registers included IKG registers included RNGDATA registers included Apply reset values for registers in Lite Medium configuration Using CRACENCORE configuration reset values

Register overview

Register	Offset	TZ	Description
CRYPTMSTRDMA.FETCHADDRLSB	0x000		Fetch Address Least Significant Word
CRYPTMSTRDMA.FETCHADDRMSB	0x004		Fetch Address Most Significant Word
CRYPTMSTRDMA.FETCHLEN	0x008		Fetch DMA Length (only used in direct mode)
CRYPTMSTRDMA.FETCHTAG	0x00C		Fetch User Tag (only used in direct mode)
CRYPTMSTRDMA.PUSHADDRLSB	0x010		Push Address Least Significant Word
CRYPTMSTRDMA.PUSHADDRMSB	0x014		Push Address Most Significant Word
CRYPTMSTRDMA.PUSHLEN	0x018		Push Length (only used in direct mode)
CRYPTMSTRDMA.INTEN	0x01C		Interrupt Enable mask
CRYPTMSTRDMA.INTENSET	0x020		Interrupt Set
CRYPTMSTRDMA.INTENCLR	0x024		Interrupt Clear
CRYPTMSTRDMA.INTSTATRAW	0x028		Interrupt Status Raw
CRYPTMSTRDMA.INTSTAT	0x02C		Interrupt Status
CRYPTMSTRDMA.INTSTATCLR	0x030		Interrupt Status Clear
CRYPTMSTRDMA.CONFIG	0x034		Cryptomaster configuration
CRYPTMSTRDMA.START	0x038		Start
CRYPTMSTRDMA.STATUS	0x03C		Status
CRYPTMSTRHW.INCLIPSHWCFG	0x400		Included IPs Hardware configuration
CRYPTMSTRHW.BA411EAESHWCFG1	0x404		Generic g_AesModesPoss value.
CRYPTMSTRHW.BA411EAESHWCFG2	0x408		Generic g_CtrSize value.
CRYPTMSTRHW.BA413HASHHWCFG	0x40C		Generic g_Hash value
CRYPTMSTRHW.BA418SHA3HWCFG	0x410		Generic g_Sha3CtxEn value.
CRYPTMSTRHW.BA419SM4HWCFG	0x414		Generic g_SM4ModesPoss value.
CRYPTMSTRHW.BA424ARIAHWCFG	0x418		Generic g_aria_modePoss value.
RNGCONTROL.CONTROL	0x1000		Control register
RNGCONTROL.FIFOLEVEL	0x1004		FIFO level register.
RNGCONTROL.FIFOTHRESHOLD	0x1008		FIFO threshold register.
RNGCONTROL.FIFODEPTH	0x100C		FIFO depth register.
RNGCONTROL.KEY[n]	0x1010		Key register.
RNGCONTROL.TESTDATA	0x1020		Test data register.
RNGCONTROL.REPEATTHRESHOLD	0x1024		Repetition test cut-off register.
RNGCONTROL.PROPTTESTCUTOFF	0x1028		Proportion test cut-off register.
RNGCONTROL.LFSRSEED	0x102C		LFSR seed register.
RNGCONTROL.STATUS	0x1030		Status register.
RNGCONTROL.WARMUPPERIOD	0x1034		Number of clock cycles in warm-up sequence.
RNGCONTROL.DISABLEOSC	0x1038		DisableOsc register.
RNGCONTROL.SAMPLINGPERIOD	0x1044		Number of clock cycles between sampling moments.
RNGCONTROL.HWCONFIG	0x1058		Hardware configuration register.
RNGCONTROL.COOLDOWNPERIOD	0x105C		Number of clock cycles in cool-down sequence.
RNGCONTROL.AUTOCORRTESTCUTOFF0	0x1060		AutoCorrTestCutoff register 0
RNGCONTROL.AUTOCORRTESTCUTOFF1	0x1064		AutoCorrTestCutoff register 1
RNGCONTROL.CORRTESTCUTOFF0	0x1068		CorrTestCutoff register 0
RNGCONTROL.CORRTESTCUTOFF1	0x106C		CorrTestCutoff register 1
RNGCONTROL.AUTOCORRTESTFAILED	0x1070		Auto-correlation test failing ring(s).
RNGCONTROL.CORRTESTFAILED	0x1074		Correlation test failing ring.
RNGCONTROL.HWVERSION	0x107C		Fixed to 1 for this version.
RNGCONTROL.FIFO[n]	0x1080		FIFO data
PK.POINTERS	0x2000		Pointers register.
PK.COMMAND	0x2004		Command register.
PK.CONTROL	0x2008		Command register.
PK.STATUS	0x200C		Status register.
PK.TIMER	0x2014		Timer register.

Register	Offset	TZ	Description
PK.HWCONFIG	0x2018		Hardware configuration register.
PK.OPSIZE	0x201C		Operand size register.
PK.ECCERRORBITPOS	0x2040		ECC Error bit position register.
PK.ECCCONTROLSTATUSREG	0x2044		ECC Control and Status register.
PK.MICROCODEFORMAT	0x2078		Microcode Format register.
PK.HWVERSION	0x207C		Hardware Version register.
IKG.START	0x3000		Start register.
IKG.STATUS	0x3004		Status register.
IKG.INITDATA	0x3008		InitData register.
IKG.NONCE	0x300C		Nonce register.
IKG.PERSONALISATIONSTRING	0x3010		Personalisation String register.
IKG.RESEEDINTERVALLSB	0x3014		Reseed Interval LSB register.
IKG.RESEEDINTERVALMSB	0x3018		Reseed Interval MSB register.
IKG.PKECONTROL	0x301C		PKE Control register.
IKG.PKECOMMAND	0x3020		PKE Command register.
IKG.PKESTATUS	0x3024		PKE Status register.
IKG.SOFTRST	0x3028		SoftRst register.
IKG.HWCONFIG	0x302C		HwConfig register.

7.8.1.9.1 CRYPTMSTRDMA.FETCHADDRLSB

Address offset: 0x000

Fetch Address Least Significant Word

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

D	RW	PUSHERBLOCKEND						Pusher DMA reached the end of a block (if enabled in the descriptor; scatter-gather only)																											
E	RW	PUSHERSTOPPED						Pusher DMA reached the end of a block with Stop=1, or end of direct transfer																											
F	RW	PUSHERERROR						Bus error during pusher DMA access																											

7.8.1.9.14 CRYPTMSTRDMA.CONFIG

Address offset: 0x034

Cryptomaster configuration

Bit number	31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID	E D C B A																															
Reset 0x00000000	0 0																															
ID	R/W	Field	Value ID	Value	Description																											
A	RW	FETCHCTRLINDIRECT			Fetcher scatter/gather. When this bit is zero, the fetcher runs in direct mode. When this bit is one, the fetcher runs in scatter-gather mode.																											
B	RW	PUSHCTRLINDIRECT			Pusher scatter/gather. When this bit is zero, the pusher runs in direct mode. When this bit is one, the pusher runs in scatter-gather mode.																											
C	RW	FETCHSTOP			Stop fetcher. When this bit is high, the fetcher will stop at the end of the current block (even if the STOP bit in the descriptor is low).																											
D	RW	PUSHSTOP			Stop pusher DMA. When this bit is high, the pusher will stop at the end of the current block (even if the STOP bit in the descriptor is low).																											
E	RW	SOFTRST			Soft reset the cryptomaster. When this bit is high, the software reset of the DMA modules, the FIFO's and the processing module will be activated. The bus is not affected (pending transfers will be completed). Set the bit to '1' for a duration of 300 ns before setting to zero again.																											

7.8.1.9.15 CRYPTMSTRDMA.START

Address offset: 0x038

Start

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

					Key0 is byte 0-3, Key1 is byte 4-7, Key2 is byte 8-11 and Key3 is byte 12-15.																															

7.8.1.9.29 RNGCONTROL.TESTDATA

Address offset: 0x1020

Test data register.

This register is used to feed known data to the conditioning function or to the continuous tests. When one word is written into this register, the 32-bit are sent to those modules. Since some time is needed for processing, there is one busy flag (TESTDATABUSY in the STATUS register) going high as soon as data is written, and going low when the next word can be written. Write access to this register is ignored when CONTROL.TESTEN is 0. Test data written through this interface is expected to be a multiple of 128 bits.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

7.8.2 GLITCHDET — Voltage glitch detectors

The system has voltage glitch detectors.

The voltage glitch detectors are automatically enabled after reset. To save power, the glitch detectors must be disabled when not in use.

Figure 32: Block diagram

7.8.3.1 Key slot

A key slot stores secure assets and up to 32 bits of additional metadata. Assets greater than 128 bits must be divided and distributed over multiple key slot instances.

The following table summarizes what can be stored in a key slot.

Field	Size [bits]	Description
METADATA	32	A text field that can be used for any purpose. This field can be read by secure code using the READMETADATA task.
DEST	32	The destination address used for the push, and used by the PUSH operation.
VALUE	128	The secure asset. This field cannot be read, only pushed to its destination address using the PUSH task.
RPOLICY	2	The revocation policy for the key slot. See Provisioning on page 181 for a detailed definition of this field.

Table 31: Key slot contents

7.8.3.1.1 Key slot states

KMU maintains the key slot state.

The following figure shows the key slot states and how they transition through the device life cycle.

Figure 33: Key slot states

7.8.3.2 Operations

KMU has operations to store, use, and remove assets.

Operation	Description
Provision	Store assets in SICR
Push	Retrieve assets from SICR and push to write-only registers or memory for use
Read metadata	Read key slot metadata from SICR
Revoke	Remove an asset from SICR
Block	Block a keyslot from being pushed, provisioned, or revoked until next reset
Push block	Block a key slot by preventing a push until next reset

Table 32: KMU operations

KMU allows a single operation to run at a time. Once a TASK is triggered to start an operation, KMU ignores any subsequent TASK requests until the initial operation is complete.

7.8.3.2.1 Provisioning

Provisioning is the storage of an asset in SICR. During provisioning, KMU copies data and revocation policy from RAM to SICR.

Provisioning a key slot is possible when the key slot is in the ERASED state.

To provision an asset, perform the following steps:

1. Populate the SRC data struct as an array in RAM.
2. Write the [SRC](#) register to the address of the SRC data in RAM. See the following table for SRC data details.
3. Configure the key slot ID in the [KEY SLOT](#) register.

4. Using the RRAM controller, enable unbuffered RRAM write using register [RRAMC.CONFIG](#). For more details on RRAMC, see [RRAMC — Resistive random access memory controller](#) on page 48.
5. Trigger the [PROVISION](#) task. KMU writes data to SICR.
If copying of data was successful, KMU generates the [PROVISIONED](#) event, otherwise KMU generates the [ERROR](#) event.
6. Disable the RRAM write operation. For details, see [RRAMC — Resistive random access memory controller](#) on page 48.

If a power failure occurs during provisioning, KMU will not write key slot data to RRAM and the key slot is not provisioned.

For more details on how to detect power failures, see [Power-fail comparator](#) on page 71.

The following lists the SRC data used for provisioning.

Field	Byte offset	Size [bytes]	Description
METADATA	24	4	32 bits of any cleartext metadata that belongs with the key slot. This metadata can later be read using the READMETADATA task (for details, see Read metadata on page 183).
DEST	20	4	32-bit destination address. Note that DEST cannot point to SICR. DEST must be on a 128-bit boundary.
RPOLICY	16	4	Revocation policy (same definition as the key slot RPOLICY field). Only two LSB's of the field are used, unused bits shall be set to zero. '11' REVOKED: When TASKS_REVOKE is triggered, key slot ends up in the Revoked state "forever" (until Erase all). '01' ROTATING: Key Slot can be reused, and when TASKS_REVOKE is triggered, the key slot ends up in the Erased state and can be reused. '10' LOCKED: Key Slot can not be revoked (until Erase all). When TASKS_REVOKE is triggered, EVENTS_ERROR is generated. '00' RESERVED: Reserved for future use. The revocation policy affects how the key slot transitions through its states, see Key slot states on page 180.
VALUE[3:0]	0	16	Asset contents/value. This value can later be used by the PUSH task (for details, see Push on page 182).

Table 33: SRC data

7.8.3.2.2 Push

Retrieving an asset from SICR is called a push. During a push, KMU copies data from SICR to the destination address that was determined during provisioning.

A key slot can be pushed only when it is in the [PROVISIONED](#) state and if it is not push-blocked. For more details on push-block, see [Push block](#) on page 183.

To push a key slot, perform the following steps:

1. Configure the key slot ID in the [KEYSLOT](#) register.
2. Trigger the [PUSH](#) task.

KMU copies data from SICR.

If the push is successful, KMU generates the [PUSHED](#) event. If the keyslot is in the REVOKED state, KMU generates the [REVOKED](#) event. If unsuccessful, KMU generates the [ERROR](#) event.

Note: Some push operations generate the [PUSHED](#) event when data is not successfully copied to the destination. For example, when the CRACEN SEEDLOCK register is set to enabled, write operations to the CRACEN SEED register are ignored.

7.8.3.2.3 Read metadata

Each key slot has a 32-bit metadata field that can be read.

The metadata field is the same 32-bit fields that is provisioned, see [Provisioning](#) on page 181.

When reading the metadata, KMU copies the key slot metadata from SICR to the [METADATA](#) register.

Key slot metadata can be read when the key slot is in the PROVISIONED state.

Perform the following steps to read key slot metadata.

1. Configure the key slot ID in the [KEYSLOT](#) register.
2. Trigger the [READMETADATA](#) task.

If the key slot is revoked, KMU generates the [REVOKED](#) event and ends the operation.

If the key slot has not been provisioned, KMU generates the [ERROR](#) event and ends the operation.

KMU copies data from SICR into the [METADATA](#) register. If copying of data was successful, KMU generates the [METADATAREAD](#) event. If unsuccessful, KMU generates the [ERROR](#) event.

7.8.3.2.4 Revoke

A key slot which is revoked can no longer be pushed.

A key slot can be revoked when it is in the PROVISIONED state or when its revocation policy is not LOCKED.

To revoke a key slot, perform the following steps:

1. Configure the key slot ID in the [KEYSLOT](#) register.
2. Enable RRAM write operation in Normal write mode. For details, see [RRAMC — Resistive random access memory controller](#) on page 48.
3. Trigger the [REVOKE](#) task.
KMU erases the asset from SICR. If revoking the key slot is successful, KMU generates the [REVOKED](#) event. If unsuccessful, or the key slot is already in the REVOKED state, KMU generates the [ERROR](#) event.
4. Disable RRAM write operation. For details, see [RRAMC — Resistive random access memory controller](#) on page 48.

Rotating key slots are available after a successful revocation. Non-rotating key slots remain in a REVOKED state and can not be used again until SICR is erased.

SICR can only be erased using the Erase All functions of [CTRL-AP — Control access port](#) on page 1181 and [RRAMC — Resistive random access memory controller](#) on page 48.

7.8.3.2.5 Push block

Push block prevents a key slot from being pushed until the next device reset.

A key slot must be in the PROVISIONED state for a push block to take effect.

To block a key slot from the push operation, perform the following steps:

1. Configure the key slot ID in the [KEYSLOT](#) register.

2. Trigger the **PUSHBLOCK** task.

When the push block has been applied, KMU generates the **PUSHBLOCKED** event.

7.8.3.2.6 Block

Block prevents a key slot from being provisioned, pushed, or revoked until the next device reset.

To block a key slot, perform the following steps:

1. Configure the key slot ID in the **KEYSLOT** register.
2. Trigger the **BLOCK** task.

When the block has been applied, KMU generates the **BLOCKED** event.

7.8.3.2.7 Error handling

Errors during KMU operations generate the **ERROR** event. Further information about the cause of the error can be found in the **ERRORSTATUS** register.

The **ERRORSTATUS** field indicates the error cause for the last attempted KMU operation, or indicates no error if the KMU operation was successful. The **ERRORSTATUS** value is cleared upon initiating a new KMU operation.

Certain types of errors will cause the KMU to enter lockup state. When the KMU is in lockup state, no further operations are possible, and all tasks are ignored. The KMU can only be returned to operational state by performing a device reset. An error causing lockup will generate the **ERROR** event, and information about the cause of the lockup error can be read in the **LOCKUPSTATUS** field. This field reads as zero when the KMU is not in lockup state.

7.8.3.3 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
KMU	GLOBAL	0x50049000	HF	S	NSA	No	Key management unit

Configuration

Instance	Domain	Configuration
KMU	GLOBAL	Number of keyslots is 250 Number of bits per keyslot is 128

Register overview

Register	Offset	TZ	Description
TASKS_PROVISION	0x0000		Provision key slot
TASKS_PUSH	0x0004		Push key slot
TASKS_REVOKE	0x0008		Revoke key slot
TASKS_READMETADATA	0x000C		Read key slot metadata into METADATA register
TASKS_PUSHBLOCK	0x0010		Block only the PUSH operation of a key slot, preventing the key slot from being PUSHED until next reset. The task is kept for backwards compatibility.
TASKS_BLOCK	0x0014		Block the PROVISION, PUSH, and REVOKE operations of a key slot, preventing the key slot from being PROVISIONED, PUSHED, or REVOKED until next reset
EVENTS_PROVISIONED	0x100		Key slot successfully provisioned

Register	Offset	TZ	Description
EVENTS_PUSHED	0x104		Key slot successfully pushed
EVENTS_REVOKED	0x108		Key slot has been revoked and can no longer be used
EVENTS_ERROR	0x10C		Error generated during PROVISION, PUSH, READMETADATA or REVOKE operations. Triggering the PROVISION, PUSH and REVOKE tasks on a BLOCKED keyslot will also generate this event.
EVENTS_METADATAREAD	0x110		Key slot metadata has been read into METADATA register
EVENTS_PUSHBLOCKED	0x114		The PUSHBLOCK operation was successful. The event is kept for backwards compatibility.
EVENTS_BLOCKED	0x118		The BLOCK operation was successful
STATUS	0x400		KMU status register
KEYSLOT	0x500		Select key slot to operate on
SRC	0x504		Source address for provisioning
METADATA	0x508		Key slot metadata as read by TASKS_READMETADATA.

7.8.3.3.1 TASKS_PROVISION

Address offset: 0x0000

Provision key slot

7.8.4 MPC — Memory Privilege Controller

The MPC peripheral is an address decoder with built-in security functions.

MPC enforces security for system memory access. It is used to divide the address space into smaller regions and assign permissions to these regions.

The main features of MPC are the following:

- Address decoding
- Configurable access permissions
- Error reporting

7.8.4.1 Override configuration

The MPC overrides are used to divide the address space into smaller regions and assign permissions to these regions.

When the device is reset, the memory in RAM and the non-volatile memory (NVM) is secure. Only secure CPUs and peripherals can read, write, or execute from secure memory.

To configure permission settings in a memory region, perform the following steps.

1. Define the memory region by configuring [STARTADDR](#) and [ENDADDR](#). The values must be multiples of the override region granularity, which is 4096.

2. Use [PERMMASK](#) to define which of the access permissions in [PERM](#) to apply.
3. Enable and lock the override using the [CONFIG](#) register.

To prevent unintended reconfiguration of MPC, all overrides should be safeguarded by using the LOCK bit in the [CONFIG](#) register.

Note: For overlapping regions, MPC will perform a logical OR between the permission bits. The logical OR applies to both [PERMMASK](#) and [PERM](#) registers. Because of this, it is not possible to retract the READ, WRITE or EXECUTE permissions. For [PERM.SECURE](#), the OR operation between Secure (1) and NonSecure (0) will result in a Secure overlap region.

Access blocking

Dedicated override regions can be used to block access to a memory region. See the [MPC configuration table](#) for which overrides are capable of access blocking.

To configure an override to block access, perform the following steps.

1. Define the memory region by configuring [STARTADDR](#) and [ENDADDR](#). The values must be multiples of the override region granularity, which is 4096.
2. Enable and lock the override using the [CONFIG](#) register.

After applying the configuration, the memory region is blocked from access. The CPU will receive a bus fault when trying to access the region.

7.8.4.2 MPC error reporting

MPC reports an error when an access violation is detected.

MPC generates an [EVENTS_MEMACCERR](#) event when an erroneous transaction is detected. The following errors can be detected.

- The address cannot be decoded or the bus Manager does not have permissions to access the Subordinate. When this happens, the [MEMACCERR.ADDRESS](#) will capture the failing address issued by the bus Manager port and [MEMACCERR.INFO](#) will capture additional access information for the attempted transaction.
- If a transaction is routed to a Subordinate, but the Subordinate responds with an error.

The [MEMACCERR](#) registers will not be updated when [EVENTS_MEMACCERR](#) is set.

7.8.4.3 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
MPC00	GLOBAL	0x50041000	HF	S	NA	No	Memory privilege controller MPC00

Configuration

Instance	Domain	Configuration
MPC00	GLOBAL	The override region granularity is 4096 bytes Overrides 0 through 6 are available for override configuration. Override 7 can be configured for access blocking. Overrides 8 through 11 are reserved by the system and cannot be configured.

Register overview

Register	Offset	TZ	Description
EVENTS_MEMACCERR	0x100		Memory Access Error event
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
MEMACCERR.ADDRESS	0x400		Target Address of Memory Access Error. Register content will not be changed as long as MEMACCERR event is active.
MEMACCERR.INFO	0x404		Access information for the transaction that triggered a memory access error. Register content will not be changed as long as MEMACCERR event is active.
OVERRIDE[n].CONFIG	0x800		Override region n Configuration register
OVERRIDE[n].STARTADDR	0x804		Override region n Start Address
OVERRIDE[n].ENDADDR	0x808		Override region n End Address
OVERRIDE[n].PERM	0x810		Permission settings for override region n
OVERRIDE[n].PERMMASK	0x814		Masks permission setting fields from register OVERRIDE.PERM

7.8.5 SPU — System protection unit

SPU configures the access privileges for a peripheral.

SPU allows configuring access controls individually for each peripheral, and for some peripheral features. For example, a DPPI channel can be configured with different access controls than the peripheral.

SPU controls access according to TrustZone security attributes. If a peripheral or feature is configured as secure, only TrustZone secure accesses are allowed. If a peripheral or feature is configured as non-secure, then accesses are allowed both from secure and non-secure masters.

For some peripherals, the peripheral's DMA has a separate security configuration. If the peripheral is configured as secure, the peripheral's DMA can be configured to perform either secure or non-secure accesses. If the peripheral is configured as non-secure, the peripheral's DMA will always perform non-secure accesses.

7.8.5.1 General concepts

The SPU provides the register interface to configure and enforce the access privileges per peripheral, and where applicable, individual features of the peripheral such as GPIO pins, DPPI channels, etc.

Any accesses to a peripheral or a peripheral feature are validated against the SPU configuration for the security attributes.

Security attributes of a peripheral normally applies to all registers of the peripheral. However, some peripherals have split security to individual features within the peripheral, such as individual pins or DPPI channels. For these split feature peripherals, access is granted on a per-bit or per-register level. Unless mentioned otherwise, the term peripheral is used in the remainder of this section to refer to both a peripheral and an individual peripheral feature.

Each APB bus has its own SPU instance that controls the resource of that bus. The SPU must be configured for security attributes of the peripherals. The SPU is always a secure peripheral.

- See [Instantiation](#) on page 232 to find the SPU instance used by the peripheral.
- The APB bus number can be extracted from the peripheral address. See [Address format](#) on page 11 to find the APB bus number for a peripheral.
- See [Block diagram](#) on page 9 for an overview over APB buses, the peripherals on that bus, and their controlling SPU instance.

See [Address format](#) on page 11 for information on extracting the Peripheral slave index from a peripheral address.

The following example shows which SPU instance to use for SAADC peripheral to configure the peripheral permissions using `PERIPH[n].PERM`:

```
#define SPU_CORTEX_ADDRESS_REGION    (0x50000000)

uint32_t perip_addr = NRF_SAADC_S_BASE;

uint32_t apb_bus_number = (perip_addr & 0x00FC0000);
uint32_t apb_slave_index = (perip_addr & 0x0003F000) >> 12;

// Get the address to the SPU instance
NRF_SPU_Type *p_spu = (NRF_SPU_Type*) (SPU_CORTEX_ADDRESS_REGION |
apb_bus_number);

// Configure PERIPH[n].PERM.SECATTR to secure for SAADC
p_spu->PERIPH[apb_slave_index].PERM =
(p_spu->PERIPH[apb_slave_index].PERM &
~SPU_PERIPH_PERM_SECATTR_Msk) |
(SPU_PERIPH_PERM_SECATTR_Secure <<
SPU_PERIPH_PERM_SECATTR_Pos)
```

See [Instantiation](#) on page 232 to find the value of SLAVE_BITS for each SPU instance.

SPU supports secure and non-secure accesses based on TrustZone. On each access to a peripheral address, the security state of the master initiating the transaction is verified against the SPU security attribute configuration of the peripheral. The following figure shows a simplified view of the SPU registers controlling several internal modules.

Figure 34: Simplified view of peripherals and peripheral features using SPU

The protection logic implements a read-as-zero/write-ignore (RAZ/WI) policy:

- A read operation that is not allowed by the SPU will always return a zero value on the bus, preventing information leak.
- A write operation that is not allowed by the SPU will be ignored.

An access error on peripherals managed by an SPU result in the PERIPHACCERR event on the SPU.

7.8.5.2 Peripheral access control

Peripheral access control depends on the security attributes.

Peripheral security attributes are defined in the *Peripheral Instantiation* table as one of the following:

Always Secure (HF S)

Access to the peripheral is always restricted to secure code.

Always Non-secure (HF NS)

Access to the peripheral is always allowed from both secure and non-secure code.

User selectable (US)

The security attribute can be configured for secure or non-secure access.

The full list of peripherals and their corresponding security attributes can be found in the *Instantiation* table in *Memory* section. For each peripheral with ID *n*, the register `PERIPH[n].PERM.SECUREMAPPING` will show whether the security attribute for this peripheral is user selectable or not.

The security attribute can be configured using the register `PERIPH[n].PERM.SECATTR`, if user selectable.

The DMA security attribute is determined as follows:

- If `PERIPH[n].PERM.DMA` is set to `NoSeparateAttribute`, then `PERIPH[n].PERM.DMASEC` cannot be configured, it has the same value as `PERIPH[n].PERM.SECATTR`.
- If `PERIPH[n].PERM.DMA` is set to `SeparateAttribute` and `PERIPH[n].PERM.SECATTR` is set to secure, then `PERIPH[n].PERM.DMASEC` is configurable. It is by default set to secure.

Secure code can access both secure peripherals and non-secure peripherals.

The DMA Privilege attribute is determined as follows:

- If `PERIPH[n].PERM.DMA` is set to `NoSeparateAttribute`, then `PERIPH[n].PERM.DMAPRIVL` cannot be configured, it has the same value as `PERIPH[n].PERM.PRIVLATTR`.
- If `PERIPH[n].PERM.DMA` is set to `SeparateAttribute` and `PERIPH[n].PERM.PRIVLATTR` is set to `Privileged`, then `PERIPH[n].PERM.DMAPRIVL` is configurable. It is by default set to `Privileged`.

7.8.5.2.1 Peripherals with split security

Peripherals with split security allow more detailed configuration.

When peripherals have split security, then the security of each feature in the peripheral can be configured individually using register `FEATURE`.

Each SPU instance can have different numbers of features. See [the instantiation table](#) for an overview of features supported by the split security peripherals.

7.8.5.2.2 Peripheral address mapping

Peripherals that have non-secure security mapping have their address starting with `0x4XXX_XXXX`.

Peripherals that have secure security mapping have their address starting with `0x5XXX_XXXX`.

Peripherals with a user-selectable security mapping are available at an address starting with:

- `0x4XXX_XXXX`, if the peripheral security attribute is set to non-secure
- `0x5XXX_XXXX`, if the peripheral security attribute is set to secure

Note: Accesses to the `0x4XXX_XXXX` address range from secure or non-secure code for a peripheral marked as secure will result in a bus-error.

Secure code accessing the `0x5XXX_XXXX` address range of a peripheral marked as non-secure will also result in a bus-error.

Peripherals with a split security mapping are available at an address starting with:

- `0x4XXX_XXXX` for non-secure access and `0x5XXX_XXXX` for secure access, if the peripheral security attribute is set to non-secure

- Secure registers in the 0x4XXX_XXXX range are not visible for secure or non-secure code, and an attempt to access such a register will generate a peripheral access error, and result in write-ignore, read as zero behavior.
- Secure code can access both non-secure and secure registers in the 0x5XXX_XXXX range
- 0x5XXX_XXXX, if the peripheral security attribute is set to secure

Note: An access to an address that is within the address range of an APB interconnect, but is not within the address range of a peripheral, will generate a peripheral access error, and result in write-ignore, read as zero behavior.

7.8.5.2.3 Special considerations for peripherals with DMA master

Peripherals containing a DMA master can be configured so the security attribute of the DMA transfers is different from the security attribute of the peripheral itself. This allows a secure peripheral to do non-secure data transfers to or from the system memories.

If the following conditions are met:

- The DMA field of `PERIPH[n].PERM.DMA` is "SeparateAttribute"
- The peripheral itself is secure (`PERIPH[n].PERM.SECATTR == 1`)

Then it is possible to select the security attribute of the DMA transfers using the field `DMASEC` (`PERIPH[n].PERM.DMASEC == Secure` and `PERIPH[n].PERM.DMASEC == NonSecure`) in `PERIPH[n].PERM`.

7.8.5.2.4 Peripheral access error reporting

The SPU generates a peripheral access error event once access violation is detected.

The following will happen if the logic controlled by the SPU detects an access violation on one of the peripherals:

- The faulty transfer will be blocked
- In case of a read transfer, the data will read as zero
- If supported by the master, feedback is sent to the master through specific bus error signals. If the master is a processor supporting Arm TrustZone for Cortex-M, a SecureFault exception will be generated for security related errors.
- The `PERIPHACCERR` event will be triggered.

7.8.5.3 Feature access control

Access to the features can be restricted. A feature can be declared as secure so that only secure peripherals can access it.

The security attribute of a feature is configured by using corresponding SPU's feature register. When the secure attribute is set for a feature, only secure peripherals and code will be able to access that feature. For example, register `FEATURE.GRTC.CC[n]` is used to configure security for the capture-and-compare functionality of the GRTC peripheral. When the secure attribute is set, only secure code can access and use the corresponding capture-and-compare registers, tasks, and events.

See [the SPU configuration](#) to find the features supported by each SPU instance.

7.8.5.5 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
SPU00	GLOBAL	0x50040000	HF	S	NA	No	System protection unit SPU00
SPU10	GLOBAL	0x50080000	HF	S	NA	No	System protection unit SPU10
SPU20	GLOBAL	0x500C0000	HF	S	NA	No	System protection unit SPU20
SPU30	GLOBAL	0x50100000	HF	S	NA	No	System protection unit SPU30

Configuration

Instance	Domain	Configuration
SPU00	GLOBAL	Supports FEATURE.DPPIC[n] Supports FEATURE.GPIO[n] SLAVE_BITS=4 (number of address bits required to represent the peripheral slave index)
SPU10	GLOBAL	Supports FEATURE.DPPIC[n] SLAVE_BITS=4 (number of address bits required to represent the peripheral slave index)
SPU20	GLOBAL	Supports FEATURE.DPPIC[n] Supports FEATURE.GPIOTE[n] Supports FEATURE.GRTC[n] Supports FEATURE.GPIO[n] SLAVE_BITS=4 (number of address bits required to represent the peripheral slave index)
SPU30	GLOBAL	Supports FEATURE.DPPIC[n] Supports FEATURE.GPIOTE[n] Supports FEATURE.GPIO[n] SLAVE_BITS=4 (number of address bits required to represent the peripheral slave index)

Register overview

Register	Offset	TZ	Description
EVENTS_PERIPHACCERR	0x100		A security violation has been detected on one or several peripherals
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
PERIPHACCERR.ADDRESS	0x404		Address of the transaction that caused first error.
PERIPH[n].PERM	0x500		Get and set the applicable access permissions for the peripheral slave index n
FEATURE.DPPIC.CH[n]	0x680		Security configuration for channel n of DPPIC
FEATURE.DPPIC.CHG[n]	0x6E0		Security configuration for channel group n of DPPIC
FEATURE.GPIOTE[n].CH[o]	0x700		Security configuration for channel o of GPIOTE[n]
FEATURE.GPIOTE[n].INTERRUPT[o]	0x720		Security configuration for interrupt o of GPIOTE[n]
FEATURE.GPIO[n].PIN[o]	0x800		Security configuration for GPIO[n] PIN[o]

Register	Offset	TZ	Description
FEATURE.GRTC.CC[n]	0xD00		Security configuration for CC n of GRTC
FEATURE.GRTC.PWMCONFIG	0xD74		Security Configuration for PWMCONFIG of GRTC
FEATURE.GRTC.CLK	0xD78		Security configuration for CLKOUT/CLKCFG of GRTC
FEATURE.GRTC.SYSCOUNTER	0xD7C		Security configuration for SYSCOUNTERL/SYSCOUNTERH of GRTC
FEATURE.GRTC.INTERRUPT[n]	0xD80		Security configuration for interrupt n of GRTC

7.8.6 TAMPC — Tamper controller

The tamper controller peripheral handles input from internal and external physical attack detectors and controls the device response.

The following figure shows an overview of the TAMPC detectors, input, and output.

Figure 35: TAMPC overview

TAMPC implements the following physical security features:

- Detection of external tampering attacks
 - Detector supporting an active driven shield mounted on a PCB that is on top of a device
- Detection of fault injection attacks (voltage glitching, electromagnetic fault injection, etc.)
 - Signal protector to guard critical configuration signals
 - Glitch detectors to protect internal logic
 - Built-in self-check for correctness inside the CRACEN

The tamper detectors are divided into two categories: external and internal. The external detectors rely on external stimuli through dedicated GPIO pins, and the internal detectors rely on internal signals not exposed outside the device package.

External tamper detectors

A tamper attack detected by any of the external tamper detectors indicates that a break-in attack is ongoing. This could include breaking the product encapsulation. This is detected through the external active shield detectors.

Internal tamper detectors

A tamper attack detected by an internal tamper detector indicates that the device's internal logic could be affected by the attack, the system state could be compromised, and thus not to be trusted. Recommended operation is to utilize the TAMPC automatic system wide reset feature, see [PROTECT.INTRESETEN.CTRL](#) on page 225. This ensures the device is operating in a safe and known state after an attack has been detected. The automatic reset from TAMPC triggers `SECTAMPER` to be set in the reset reason register. The device should on the following reset check for `SECTAMPER` in the reset reason register and take necessary action.

7.8.6.1 Active shield

TAMPC supports an active shield to protect against physical access to the device and its connections on the PCB level.

The active shield detector is enabled using the register [PROTECT.ACTIVESHIELD.CTRL](#) on page 220. The active shield detector has a number of channels. Depending on its configuration, TAMPC will react when a channel in the active shield is broken, meaning there is a mismatch between the input and output signal of an enabled channel in the active shield. A broken channel detected in the active shield causes one of the following to occur:

- A TAMPC event is generated.
- A chip reset is triggered and the `SECTAMPER` value in the reset reason register indicates what happened, depending on the status of the register [PROTECT.EXTRESETEN.CTRL](#) on page 224.

A channel in the active shield detector consists of a signal propagating from an output pin to an input pin. The channels are enabled using the `CH[i]` fields in the register [ACTIVESHIELD.CHEN](#) on page 215. The GPIO pins reserved for the active shield detector channels must be configured before the channels are ready for use. Pin direction and `CTRLSEL` must be set according to the register interface in the GPIO peripheral. For more information about reserved active shield detector pins, see [Pin assignments](#) on page 1219. Pins reserved for the active shield detector can be used as generic GPIO pins when the channel is unused.

The active shield detector contains a Pseudo-Random Bit Sequence (PRBS) generator. A PRBS signal is generated on an output pin at each rising edge of the 32 KHz clock. The signal is routed through an external shield to an input pin. The signal on the input pin is sampled on the falling edge of the 32KHz clock. If the sampled signal does not match the transmitted signal, a channel in the external shield is assumed broken and a tamper event is generated.

7.8.6.2 CRACEN tamper detector

The cryptographic accelerator engine (CRACEN) implements a separate tamper detector mechanism. This tamper detector is always enabled.

CRACEN has security countermeasures and notifies TAMPC if tampering is detected during its operations. TAMPC will react according to the register setting in [PROTECT.CRACENTAMP.CTRL](#) and one of the following will occur:

- A TAMPC event is generated.
- A chip reset is triggered and the `SECTAMPER` value in the reset reason register indicates what happened, depending on the status of the register [PROTECT.INTRESETEN.CTRL](#) on page 225.

The internal tamper reset enable signal [INTRESETEN](#) is enabled from reset.

For more information about CRACEN countermeasures, see [CRACEN — Cryptographic accelerator engine](#) on page 144.

7.8.6.3 Glitch detector

The device implements glitch detectors to protect against fault injection attacks.

Detectors are strategically placed to detect fault injection attacks. The detectors are designed and tuned to trigger before logic fails enabling the digital logic to react before an injected fault is propagated through the system.

The glitch detectors are enabled from reset and can be disabled for debugging using

- [PROTECT.GLITCHSLOWDOMAIN.CTRL](#) on page 222
- [PROTECT.GLITCHFASTDOMAIN.CTRL](#) on page 223

When an internal tamper event is detected, one of the following will occur:

- A TAMPC EVENT is generated.

- A chip reset is triggered and the `SECTAMPER` value in the reset reason register indicates what happened, depending on the status of the register `PROTECT.INTRESETEEN.CTRL` on page 225.

7.8.6.4 Signal protector

The device implements detectors to protect selected signals that control critical device features.

The signal protector implements one detector per protected signal to detect unintentional value changes in that signal. The detector notifies TAMPC if a protected signal changes value caused by tampering. The detectors are enabled from reset and can be disabled using the register `PROTECT.INTRESETEEN.CTRL`, which is for debugging purposes only. A detected unintentional value change in any of the protected signals leads to an internal tamper event where one of the following occur:

- A TAMPC event is generated.
- A chip reset is triggered and the `SECTAMPER` value in the reset reason register indicates what happened, depending on the status of the register `PROTECT.INTRESETEEN.CTRL` on page 225.

The `INTRESETEEN` register is enabled from reset. The `PROTECT.<component>.STATUS` registers indicate which protected signal had an unintentional value change when the register `INTRESETEEN` is disabled.

The signal protector implements a two stage write cycle to change the value of a protected signal, in addition to a required write key which must be included for all register writes. The two stages are the following:

1. Initial register write to clear the write protection.
2. Register write to change the signal's value.

Write `Clear` to the `WRITEPROTECTION` field in the `PROTECT.<component>.CTRL` register to clear the write protection in the first register write. Then write to the `VALUE` and `LOCK` fields in the next register write operation.

Note: It is required to clear the `WRITEPROTECTION` field before any updates to the `VALUE` and `LOCK` fields are accepted by the register.

The write protection is automatically re-enabled after the subsequent write to change the `VALUE` field when the register write does not include the `Clear` value in the `WRITEPROTECTION` field.

The `LOCK` field controls a lock feature which prevents further updates to the `VALUE` and `LOCK` fields until a reset with the required reset source for the specific signal is issued.

A `WRITEERROR` event is generated for any of the following conditions:

- Register write does not have the correct write key
- Write protection is active and the write operation does not contain the value to clear the write protection
- The lock is enabled

The sequence to change the `VALUE` or `LOCK` fields in the `PROTECT.<component>.CTRL` registers is as follows:

1. Write `Clear` to the `WRITEPROTECTION` field and `KEY` to the `KEY` field.
2. Write `Disabled` to the `WRITEPROTECTION` field, `KEY` to the `KEY` field, and `KEY` to the desired `LOCK` and `VALUE` fields.

7.8.6.4.1 Debugger signals

TAMPC provides protection for the following Arm CoreSight™ debugger signals.

Signal	Name	Notes
NIDEN	Non-Invasive Debug Enable	ETM/ITM trace and other non-halting debug methods
DBGEN	Invasive Debug Enable	The debugger may halt the CPU for debug purposes
SPNIDEN	Secure Privileged Non-Invasive Debug Enable	Same as NIDEN with a secure TrustZone security attribute
SPIDEN	Secure Privileged Debug Enable	Same as DBGEN with a secure TrustZone security attribute

Table 34: TAMPC protected debugger signals

See the appropriate *Arm CoreSight Technical Reference manual* for details on these signals.

For more information about using the protected debugger signals, see [Debug and trace](#) on page 1174.

7.8.6.5 TAMPC reset behavior

TAMPC registers are reset by different sources.

Protected signals in TAMPC are divided into the following reset source categories.

- Category 1 – Brownout reset, power-on reset
- Category 2 – Pin reset and TAMPC reset
- Category 3 – Watchdog timer reset, CPU lockup reset, System reset request, and Wake-up from System OFF reset

For more information about reset sources, see [RESET — Reset control](#) on page 109.

Register	Function	Reset value	Reset source		
			Cat 1	Cat 2	Cat 3
PROTECT.DOMAIN[0].DBGEN	Allow invasive debugging in non-secure mode of Arm Cortex-M33.	0	x	x	
PROTECT.DOMAIN[0].NIDEN	Allow non-invasive debugging in non-secure mode of Arm Cortex-M33.	0	x	x	
PROTECT.DOMAIN[0].SPIDEN	Allow invasive debugging in secure mode of Arm Cortex-M33.	0	x	x	
PROTECT.DOMAIN[0].SPNIDEN	Allow non-invasive debugging in secure mode of Arm Cortex-M33.	0	x	x	
PROTECT.AP[0].DBGEN	Allow debugging of FLPR RISC-V CPU.	0	x	x	
PROTECT.ACTIVESHIELD	Enable active shield detector.	0	x	x	x
PROTECT.CRACENTAMP	Enable CRACEN tamper detector.	1	x	x	x
PROTECT.GLITCHSLOWDOMAIN	Enable slow domain glitch detector.	1	x	x	x
PROTECT.GLITCHFASTDOMAIN	Enable fast domain glitch detector.	1	x	x	x
PROTECT.EXTRESETEN	Enable automatic reset from external tamper detectors events.	0	x	x	x
PROTECT.INTRESETEN	Enable automatic reset from internal tamper detector events.	1	x	x	x
PROTECT.ERASEPROTECT	Allow device erase using CTRL-AP and RRAMC.	0	x	x	x

Table 35: TAMPC protected signals

7.8.6.6 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
TAMPC	GLOBAL	0x500EF000	HF	S	NA	No	Tamper controller TAMPC

Configuration

Instance	Domain	Configuration
TAMPC	GLOBAL	For the active shield function, use dedicated pins on P1 Reset value of field VALUE in register PROTECT.INTRESETEN.CTRL: 1

Register overview

Register	Offset	TZ	Description
EVENTS_TAMPER	0x100		Tamper controller detected an error.
EVENTS_WRITEERROR	0x104		Attempt to write a VALUE in PROTECT registers without clearing the WRITEPROTECT.

Register	Offset	TZ	Description
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
STATUS	0x400		The tamper controller status.
ACTIVESHIELD.CHEN	0x404		Active shield detector channel enable register.
PROTECT.DOMAIN[n].DBGEN.CTRL	0x500		Control register for invasive (halting) debug enable for the local debug components within domain n.
PROTECT.DOMAIN[n].DBGEN.STATUS	0x504		Status register for invasive (halting) debug enable for domain n.
PROTECT.DOMAIN[n].NIDEN.CTRL	0x508		Control register for non-invasive debug enable for the local debug components within domain n.
PROTECT.DOMAIN[n].NIDEN.STATUS	0x50C		Status register for non-invasive debug enable for domain n.
PROTECT.DOMAIN[n].SPIDEN.CTRL	0x510		Control register for secure privileged invasive (halting) debug enable for the local debug components within domain n.
PROTECT.DOMAIN[n].SPIDEN.STATUS	0x514		Status register for secure privileged invasive (halting) debug enable for domain n.
PROTECT.DOMAIN[n].SPNIDEN.CTRL	0x518		Control register for secure privileged non-invasive debug enable for the local debug components within domain n.
PROTECT.DOMAIN[n].SPNIDEN.STATUS	0x51C		Status register for secure privileged non-invasive debug enable for domain n.
PROTECT.AP[n].DBGEN.CTRL	0x700		Control register to enable invasive (halting) debug in domain ns access port.
PROTECT.AP[n].DBGEN.STATUS	0x704		Status register for invasive (halting) debug enable for domain ns access port.
PROTECT.ACTIVESHIELD.CTRL	0x900		Control register for active shield detector enable signal.
PROTECT.ACTIVESHIELD.STATUS	0x904		Status register for active shield detector enable signal.
PROTECT.CRACENTAMP.CTRL	0x938		Control register for CRACEN tamper detector enable signal.
PROTECT.CRACENTAMP.STATUS	0x93C		Status register for CRACEN tamper detector enable signal.
PROTECT.GLITCHSLOWDOMAIN.CTRL	0x940		Control register for slow domain glitch detectors enable signal.
PROTECT.GLITCHSLOWDOMAIN.STATUS	0x944		Status register for slow domain glitch detectors enable signal.
PROTECT.GLITCHFASTDOMAIN.CTRL	0x948		Control register for fast domain glitch detectors enable signal.
PROTECT.GLITCHFASTDOMAIN.STATUS	0x94C		Status register for fast domain glitch detectors enable signal.
PROTECT.EXTRESETEN.CTRL	0x970		Control register for external tamper reset enable signal.
PROTECT.EXTRESETEN.STATUS	0x974		Status register for external tamper reset enable signal.
PROTECT.INTRESETEN.CTRL	0x978		Control register for internal tamper reset enable signal.
PROTECT.INTRESETEN.STATUS	0x97C		Status register for internal tamper reset enable signal.
PROTECT.ERASEPROTECT.CTRL	0x980		Control register for erase protection.
PROTECT.ERASEPROTECT.STATUS	0x984		Status register for eraseprotect.

7.8.6.6.1 EVENTS_TAMPER

Address offset: 0x100

Tamper controller detected an error.

7.8.6.7 STATUS

Address offset: 0x400

The tamper controller status.

Note: Unless cleared, the STATUS register will be cumulative. A field is cleared by writing '1' to it.

Note: The glitch detectors must be reset using their CTRL registers before the STATUS register bits for glitch detectors can be cleared. The glitch detector continuously drives its output status signal to the STATUS register, hence clearing only the STATUS register is not sufficient.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

8 Peripherals

The device features a rich set of peripherals. The following sections describe the peripherals and how they are used.

8.1 Peripheral interface

Peripherals are controlled by the CPU through configuration, task, and event registers. Task registers are inputs, enabling the CPU and other peripherals to initiate a functionality. Event registers are outputs, enabling a peripheral to trigger tasks in other peripherals or the CPU by tying events to CPU interrupts.

Figure 36: Peripheral interface

The distributed programmable peripheral interconnect (DPPI) feature enables peripherals to connect events to tasks without CPU intervention. For more information on DPPI and the DPPI channels, see [DPPI — Distributed programmable peripheral interconnect](#) on page 119.

8.1.2 Peripheral ID

Each peripheral is assigned a fixed block of address space that is minimum 4 KB in size and has at least 1024 registers of 32 bits.

For more information on available peripherals and their location in the address map, see [Instantiation](#) on page 232.

There is a direct relationship between peripheral ID and base address:

```
base_address = 0x40000000 + 0x1000 * ID
```

Example peripheral base addresses:

- 0x40000000 is assigned ID=0
- 0x40001000 is assigned ID=1
- 0x4001F000 is assigned ID=31

Peripherals can share the same ID, which has the following limitations:

- Shared registers or common resources
- Limited availability due to mutually exclusive operation; only one peripheral in use at a time
- Enforced peripheral behavior when switching between peripherals (disable the first peripheral before enabling the second)

8.1.3 Peripherals with shared ID

Peripherals sharing ID [1...n] and a base address may not be used simultaneously. Only one peripheral can be enabled at a given ID.

When switching between two peripherals sharing an ID, perform the following to prevent unwanted behavior.

1. Disable the previously used peripheral.
2. Disable any publish/subscribe connection to the DPPI system for the peripheral that is being disabled.
3. Clear all bits in the INTEN register (INTENCLR = 0xFFFFFFFF).
4. Configure the peripheral being enabled. Do not rely on the inherited configuration from the disabled peripheral.
5. Enable the peripheral.

For a list of peripherals that share an ID, see [Instantiation](#) on page 232.

8.1.4 Peripheral registers

Most peripherals have an ENABLE register. Unless otherwise specified, the peripheral registers must be configured before enabling the peripheral.

PSEL registers must be set before a peripheral is enabled or started. Updating PSEL registers while the peripheral is running can cause undefined behavior. To connect a peripheral to a different GPIO, the following must be performed:

1. Disable the peripheral.
2. Update the PSEL register.
3. Re-enable the peripheral.

Note: The peripheral must be enabled before tasks and events can be used.

Most of the register values are not retained during System OFF or when a reset is triggered. Some registers will retain their values in System OFF or for some specific reset sources. These registers are marked as

retained in the register description for a given peripheral. For more information on their behavior, see chapter [RESET — Reset control](#) on page 109.

8.1.5 Bit set and clear

Registers with multiple single-bit fields can implement the set-and-clear bit pattern. This bit pattern enables firmware to set and clear individual bits in a register without having to perform a read-modify-write operation to the main register.

This bit pattern is implemented using three consecutive addresses in the register map, where the main register is followed by dedicated SET and CLR registers (in that exact order).

In the main register, the SET register sets individual bits and the CLR register clears them. Writing 1 to a bit in the SET or CLR register will set or clear the same bit in the main register. Writing 0 to a bit in the SET or CLR register has no effect. Reading the SET or CLR register returns the value of the main register.

Note: The main register may not be visible, and therefore not directly accessible in all cases.

8.1.6 Tasks

Tasks trigger actions in a peripheral, such as to start a particular behavior. A peripheral can implement multiple tasks, with each task having a separate register in that peripheral's task register group.

A task is triggered when firmware writes 1 to the task register, or when the peripheral itself or another peripheral toggles the corresponding task signal. See the figure [Peripheral interface](#) on page 228.

8.1.7 Events

Events notify peripherals and the CPU about events that have happened, such as a state change in a peripheral. A peripheral may generate multiple events, where each event has a separate register in that peripheral's event register group.

An event is generated when the peripheral toggles the corresponding event signal and updates the event register to show an event has been generated, see figure [Peripheral interface](#) on page 228. An event register is cleared when firmware writes a 0 to that register. A peripheral can continually generate events when the event register is 1.

8.1.8 Publish and subscribe

Events and tasks from different peripherals can be connected together through the DPPI system using the PUBLISH and SUBSCRIBE registers in each peripheral. See [Peripheral interface](#) on page 228.

An event can be published onto a DPPI channel by configuring the event's PUBLISH register. Similarly, a task can subscribe to a DPPI channel by configuring the task's SUBSCRIBE register.

See [DPPI — Distributed programmable peripheral interconnect](#) on page 119 for details.

8.1.9 Shortcuts

A shortcut is a direct connection between an event and a task within the same peripheral. If a shortcut is enabled, the associated task is automatically triggered when its associated event is generated.

Using shortcuts is the same as connecting a task and event outside the peripheral through the DPPI. The propagation delay for a shortcut is usually shorter than the propagation delay through the DPPI.

Shortcuts are predefined, which means that their connections cannot be configured by firmware. Each shortcut can be individually enabled or disabled through the shortcut register, one bit per shortcut, giving a maximum of 32 shortcuts for each peripheral.

8.1.10 Interrupts

All peripherals support interrupts generated by events.

Events generated by a peripheral can be configured to generate interrupts using registers INTEN, INTENSET, and INTENCLR. Multiple events can be enabled to generate interrupts simultaneously. Event registers in the peripheral register event group indicate the source.

Some peripherals implement only INTENSET and INTENCLR registers. The INTEN register is not available on those peripherals. See the individual peripheral chapters for details. In all cases, reading back the INTENSET or INTENCLR register returns the same information as INTEN.

The INTPEND register contains the interrupt pending status of events generated by a peripheral. This is a read-only register. To clear bits from INTPEND, clear the corresponding event register.

Each event implemented in the peripheral is associated with a specific bit position in the INTEN, INTENSET, and INTENCLR registers.

To ensure the lowest possible power consumption while in sleep, perform either of the following steps on any pending interrupts:

- Clear the pending interrupt by writing 0 to the corresponding EVENT register
- Disable the interrupt by using the INTEN or INTENCLR registers

This has to be done even if the peripheral is disabled in its ENABLE or POWER register.

The relationship between tasks, events, shortcuts, and interrupts is illustrated in [Peripheral interface](#) on page 228.

A peripheral can occupy single or multiple interrupts. For single interrupts, the interrupt number follows the peripheral ID. For example, the peripheral with ID=4 is connected to interrupt number 4 in the nested vectored interrupt controller (NVIC). In this case, only single INTEN registers are available.

Peripherals implementing multiple interrupts have several INTEN registers that follow the convention of INTEN_n, where n is the interrupt number from the peripheral. This also applies to corresponding INTPEND, INTENSET, and INTENCLR registers. This feature enables any event to generate an interrupt from the peripheral.

Peripherals implementing more than 32 events have access to multiple INTEN registers that follow the convention of INTEN_n, where n is the event group number. The 32 lowest events in the peripheral make event group 0. The next 32 events in the peripheral make event group 1, and so on. This convention is also applicable for corresponding INTPEND, INTENSET, and INTENCLR registers.

Peripherals implementing both multiple interrupts and more than 32 events have multiple INTEN registers. In this case, registers follow the convention of INTEN_{nm}, where n is interrupt number from the peripheral and m is event group number. This convention is also applicable for corresponding INTPEND, INTENSET, and INTENCLR registers.

8.1.10.1 Interrupt clearing and disabling

Interrupts must be cleared by writing 0 to the corresponding EVENT register.

Interrupts are immediately re-triggered until cleared. Routines for software interrupt services continue to execute, even if a new event has not been received.

Table 36: Instantiation table

8.3 AAR — Accelerated address resolver

Accelerated address resolver is a cryptographic support function for implementing the Resolvable Private Address Resolution Procedure described in the *Bluetooth Core specification*.

The main features of AAR are:

- Memory-to-memory operations using Scatter/Gather DMA
- Real-time address resolution on incoming packets
- Multiple IRK resolution

The procedure allows two devices that share a secret key to generate and resolve a hash based on their device address. AAR enables real-time address resolution on incoming packets when configured as described in this chapter. This allows real-time packet filtering (whitelisting) using a list of known shared keys (Identity Resolving Keys (IRK) in *Bluetooth*).

The inputs and outputs of AAR are illustrated in the following figure.

Figure 37: AAR block diagram

8.3.1 Shared resources

AAR shares the same AES module as the ECB and CCM peripherals. ECB will always have the lowest priority. If there is a sharing conflict during encryption, ECB operation will be aborted and an `ERRORECB` event will be generated by ECB.

Additionally, AAR shares registers and other resources with the peripherals that have the same ID as AAR. See [Peripherals with shared ID](#) on page 229 for more information.

8.3.2 Resolving a resolvable address

As per *Bluetooth* specification, a private resolvable address is composed of six bytes.

Figure 38: Resolvable address

To resolve an address, **IN.PTR** must point to a job list describing both the Hash and Prand parts of the private resolvable address (**DEVICEADDR**) field from the Bluetooth packet, as well as a number of Identity Resolving Keys (IRK). This is illustrated in the examples below. How many IRKs are used is determined by the number of IRKs in the job list. See [EasyDMA](#) on page 239 for an introduction to EasyDMA job lists.

The resolver is started by triggering the **START** task. A **RESOLVED** event is generated if AAR manages to resolve the address using one of the Identity Resolving Keys (IRK). AAR will generate a **NOTRESOLVED** event if it is not able to resolve the address using the specified list of IRKs. If there are no IRKs in the joblist, the **NOTRESOLVED** event is generated.

Figure 39: Address resolution with 16 IRKs and **DEVICEADDR** preloaded into RAM

Figure 40: Address resolution with packet device address preloaded into multiple RAM locations, and three IRK keys

AAR will go through the list of available IRKs in the job list, and for each IRK try to resolve the address according to the Resolvable Private Address Resolution Procedure described in the *Bluetooth Specification*². The time it takes to resolve an address may vary depending on where in the list the resolvable address is located. The resolution time will also be affected by RAM accesses performed by other peripherals and the CPU. See the Electrical specifications for more information about resolution time.

Note: Maximum number of IRKs supported in a job list is 4096.

AAR only compares the received address to those programmed in the module without checking the address type.

AAR will stop when it has managed to resolve the maximum number allowed, specified in the **MAXRESOLVED** register. Each time AAR resolves an IRK, the index of the corresponding IRK is written to memory through the output job list in **OUT.PTR**. For each IRK found, **OUT.AMOUNT** is updated accordingly.

The output job list must define a memory region large enough to hold list of resolved IRK indices. This is calculated from the **MAXRESOLVED** register, where each IRK index occupies two bytes in memory. In the example below, the *n* indicates the number of bytes (size) in the resolved IRK index array. The value of *n* must be exactly 2 times the value of **MAXRESOLVED**.

² *Bluetooth Specification Version 4.0 [Vol 3] chapter 10.8.2.3.*

Figure 41: Resolved IRK index structure at RAM

At the end of the operation, AAR will generate the **END** event.

Triggering the **STOP** task will stop AAR. If AAR is stopped before the operation has completed, the **END**, **RESOLVED**, and **NOTRESOLVED** events are not generated. However, if **STOP** is triggered close to the end of the operation the events can be generated.

8.3.3 EasyDMA

This peripheral implements EasyDMA with scatter-gather functionality for reading from memory without CPU involvement.

The scatter-gather functionality allows EasyDMA to collect data from multiple memory regions, instead of one contiguous block. The memory regions are described by a job list, called input job list. The job list consists of one or more job entries that consist of a 32-bit address field, 8-bit attribute field, and 24-bit length field. A job list ends with a zero filled job entry.

The input job list must have separate entries for the following entries:

1. The three first bytes of the resolvable private address (the 24-bit hash)
2. The three following bytes of the resolvable private address (the 24-bit prand)
3. The IRKs

The attribute field of each of these entries identify the input job and must be set according to the following table.

Attribute	Value
Hash	11
Prand	12
Irk	13

Table 37: Attribute field for input job list

If the **IN.PTR** register or the entries in the input job list are not pointing to memory connected to the DMA bus, an EasyDMA transfer may result in a HardFault or memory corruption. See **Memory** on page 13 for more information about the different memory regions and DMA connectivity.

The EasyDMA will have finished accessing the RAM when the **END**, **RESOLVED**, or **NOTRESOLVED** events are generated.

For instances supporting DMA error detection, the **ERRORSTATUS** register will report if a bus error has occurred during DMA access. To see if DMA error detection is supported, see the the instance's configuration in **Instantiation** on page 232.

The list of the resolved IRK indices are stored in memory using the output job list, configured by **OUT.PTR**.

Attribute	Value
Resolved Irk index	11

Table 38: Attribute field for output job list

Example

The figure below shows an example of a job list with three job entries. Each of the entries point to a memory address, and the length field describes how many bytes of data is stored at that address. There are three blocks of memory in use

- Hash, an array of length 3
- Prand, an array of length 3
- Irk, an array of at least length 16

The data pointed to from the job list is what is fed into the module and processed according to the peripheral's operation. The entries of the job list comprises pointers to the individual arrays, as well as their sizes. Job entries with length greater than one are processed in little endian order.

Figure 42: EasyDMA Scatter-Gather job list example

8.3.4 Use case example for chaining RADIO packet reception with address resolution using AAR

AAR may be started as soon as the 6 bytes required by AAR have been received by RADIO and stored in RAM. The Hash and Prand part of the job list must point to the part of the packet containing the device address.

Figure 43: Address resolution with packet loaded into RAM by RADIO

8.4 AXONS — Neural processing unit

Axon NPU is an ultra-low power neural network accelerator built for artificial intelligence (AI) and machine learning (ML) applications. It enables real-time processing while keeping power consumption to a minimum, making it perfect for IoT edge computing where battery life is critical.

Note: Axon NPU is only available in selected device variants. For more information on Axon NPU device availability, see [Product overview](#) on page 9.

The main features of Axon NPU are the following:

- Fast and power efficient execution of neural network operators
- End-to-end execution with little to no CPU intervention for most operators
- Support for quantized int8 models.
- Flexible DMA and execution pipeline that can support many functions beyond traditional neural network operators
- Compatible with a software tool chain and driver that stay up to date with growing Axon NPU functionality
- Acceleration of int24 DSP vector operations square root, natural log, exponent, and FFT

Figure 44: Block diagram

Optimized for battery-powered devices, Axon NPU is a high-performance yet energy-efficient solution for wearables, security systems, health monitoring, and other IoT applications. By reducing power usage, it extends system battery life without compromising processing speed, ensuring reliable performance even in resource-limited environments.

Axon NPU is intended for use with the libraries in Nordic Semiconductor device SDKs. Base operations include convolution (1D and 2D), Fully Connected, Add, Multiply, and Pooling (average and max). See the Axon NPU toolchain documentation for a complete list of limits and currently supported functionality.

8.5 CCM — AES CCM mode encryption

Counter with cipher block chaining - message authentication code (CCM) mode is an authenticated encryption algorithm designed to provide both authentication and confidentiality (encryption/decryption) during data transfer.

The main features of CCM are:

- Memory-to-memory packet encryption and decryption operations using Scatter/Gather DMA
- Support for Bluetooth requirements and algorithm as defined in IETF [RFC3610](#)
- Support for IEEE 802.15.4
- Concurrent operation with RADIO

AES CCM combines counter (CTR) mode encryption and cipher block chaining - message authentication code (CBC-MAC) authentication. The CCM terminology message authentication code (MAC) is called message integrity check (MIC) in *Bluetooth* terminology, and also in this document.

Figure 45: CCM Overview

CCM generates an encrypted keystream that is applied to input data using the XOR operation and generates an M byte MAC field in one operation. CCM and RADIO can be configured to work

synchronously. CCM will encrypt in time for transmission and decrypt after receiving bytes into memory from the radio. All operations can complete within the packet RX or TX time. CCM on this device is implemented to support the Bluetooth requirements and the algorithm as defined in IETF [RFC3610](#), and depends on the AES-128 block cipher. A description of the CCM algorithm can also be found in [NIST Special Publication 800-38C](#). The Bluetooth specification describes the configuration of counter mode blocks and encryption blocks to implement compliant encryption for Bluetooth Low Energy.

CCM uses EasyDMA to read/write additional authenticated data, plain text and cipher text.

Two operations are supported:

- Packet encryption
- Packet decryption

All operations are done in compliance with the *Bluetooth Core Specification*, as well as IEEE 802.15.4.

8.5.1 Shared resources

The CCM shares the same AES module as the AAR and ECB peripherals. The ECB will always have the lowest priority. If an operation is aborted due to a conflict among the shared resources, an ERROR event will be generated.

Additionally, the CCM shares registers and other resources with the peripherals that have the same ID as the CCM. See [Peripherals with shared ID](#) on page 229 for more information.

8.5.2 Encryption and decryption

CCM supports both packet encryption and decryption.

The following table shows the different CCM input/output and parameters supported by the CCM module for encryption and decryption:

Parameter	Valid input	Description
M	0, 4, 6, 8, 10, 12, 14, 16	Number of bytes in the authentication field
L	2 (fixed)	Number of bytes in the length field
I(a)	0-65279	Number of bytes in additional authenticated data
I(m)	0-(65535 - M)	Number of bytes in the message to authenticate and encrypt
I(c)	0-65535	Number of bytes in the encrypted message; I(m) + M bytes
a	I(a) number of bytes	Additional authenticated data
m	I(m) number of bytes	Message to authenticate and encrypt
c	I(c) number of bytes	Encrypted message

Table 39: CCM Parameters

In addition to the parameters listed above, the CCM requires two sets of data: a 128-bit key and a 128-bit nonce. These are supplied via dedicated register interfaces: [KEY.VALUE](#) registers for the 128-bit key, and [NONCE.VALUE](#) registers for the 128-bit nonce. The 128-bit key in the [KEY.VALUE](#) registers is stored in reverse byte order relative to the payload. For example, using the sample session key from the Bluetooth Core Specification v5.4, Volume 6, Part C, chapter 1.2:

- Session Key (SK): 99AD1B5226A37E3E058E3B8E27C2C666

The **KEY.VALUE** registers are populated as follows:

- **KEY.VALUE[0]** = 0x27C2C666
- **KEY.VALUE[1]** = 0x058E3B8E
- **KEY.VALUE[2]** = 0x26A37E3E
- **KEY.VALUE[3]** = 0x99AD1B52

The same reverse byte order is used for the **NONCE.VALUE** registers. For the packet example "3. Data packet1" with the following values:

- IV: DEAFBABEBADCAB24
- Direction Bit: 1
- Packet Counter: 1

The **NONCE.VALUE** registers are populated as follows:

- **NONCE.VALUE[0]** = 0xBEBAAFDE
- **NONCE.VALUE[1]** = 0x24ABDCBA
- **NONCE.VALUE[2]** = 0x00000080
- **NONCE.VALUE[3]** = 0x00000001

Note: Although the NONCE in the example above is 13 bytes, it must be written as a 16-byte value with the first 3 bytes zero-padded.

Note: The KEY and NONCE byte order is reversed compared to the NRF52 and NRF53 series devices.

8.5.2.1 Encryption

During packet encryption, CCM will read the unencrypted packet located in memory at the address specified in register **IN.PTR**, encrypt the packet and append an M byte long message authentication code (MAC) field to the packet.

The message to authenticate and encrypt (m) and additional authenticated data (a) are included in the MAC generation. The first byte in the packet header can be masked by configuring the **ADATAMASK** register. This is useful for Bluetooth header masking. For protocols other than Bluetooth, the **ADATAMASK** register must be set to 0xFF for correct CCM operation; the reset value is configured to support Bluetooth.

Encryption is started by triggering the **START** task with the **MODE** register set to **Encryption**. The **END** event will be generated when packet encryption is completed.

The AES CCM will modify the l(c) output field of the packet to adjust for the appended MAC field, that is, add **MODE.MACLEN** bytes to l(m), and store the resulting packet back into memory at the locations specified in the **OUT.PTR** list, as illustrated in the following figure. The maximum length of l(m) plus **MODE.MACLEN** cannot exceed 65535 bytes.

Figure 46: Encryption

If the following occurs, the **ERROR** event is generated, the CCM stops, and the **ERRORSTATUS** register will report the type of error that triggered the **ERROR** event:

- The **IN.PTR** job list ends before reading out the complete CCM data structure
- The **OUT.PTR** job list ends before writing out the complete encrypted CCM data structure
- The CCM is not able to operate fast enough to run concurrently with the RADIO as the RADIO transmits the encrypted packet.
- The EasyDMA engine encounters an error, see [EasyDMA and ERROR event](#) on page 257

Any values of $l(m)$ and $l(a)$ are allowed. If encrypting empty packets, i.e. $l(m) = l(a) = 0$, no encryption will take place; the **END** event is generated, and CCM operation is stopped.

For Bluetooth (**MODE.PROTOCOL=BLE**), valid packets with 0 payload ($l(a)$ is larger than 0 but $l(m)$ is 0) will not be authenticated but instead moved unmodified through the AES CCM peripheral, and thus no MAC will be generated.

For IEEE 802.15.4 (**MODE.PROTOCOL=IEEE802154**), valid packets with 0 payload ($l(a)$ is larger than 0 but $l(m)$ is 0) will be authenticated, and thus a MAC will be generated as part of the output data.

8.5.2.2 Decryption

During packet decryption, CCM will read the encrypted packet located in memory at the address specified in the **IN.PTR** pointer, decrypt the packet, authenticate the packet's MAC field and generate the appropriate MAC status.

The encrypted message in (c) , is decrypted and authenticated together with additional authenticated data (a) and then matched against the decrypted MAC value. The decrypted MAC value is part of (c) . Bits in the first byte of the data can be masked away before calculating the MAC value by configuring the **ADATAMASK** register. This is useful for Bluetooth header masking. For protocols other than Bluetooth, the **ADATAMASK** register must be set to 0xFF for correct CCM operation; the reset value is configured to support Bluetooth.

Decryption is started by triggering the **START** task with the **MODE** register set to **FastDecryption**.

CCM will write the $I(m)$ value of the decrypted packet to the location provided in **OUT.PTR**, and then store the decrypted packet into memory at the locations given by the **OUT.PTR** list as illustrated in the following figure.

Figure 47: Decryption

For Bluetooth (**MODE.PROTOCOL=BLE**), CCM is only able to authenticate messages where $I(c)$ is at least $MACLEN+1$ bytes long. If $I(c)$ is less than $MACLEN+1$, CCM will generate an **END** event and clear the **MACSTATUS** (indicating MAC check failure). Furthermore, empty packets ($I(c)=0$) will be moved unmodified through the AES CCM peripheral even though **ERROR** event shall be generated. In any other case that leads to a failed **MACSTATUS** or an **ERROR** event, the contents of the job addresses given in **OUT.PTR** are undefined.

For IEEE 802.15.4 (**MODE.PROTOCOL=IEEE802154**), CCM will also perform authentication on messages where only ADATA is present (i.e. $I(m)=0$ and $I(a)>0$). In this case **MACSTATUS** reflects the result of the authentication. If $I(c)<MACLEN$, then the **ERROR** event is generated, and the contents of the locations given in **OUT.PTR** are undefined.

If the following occurs, the **ERROR** event is generated, and CCM is stopped.

- The **IN.PTR** job list ends before reading out the complete CCM data structure
- The **OUT.PTR** job list ends before writing out the complete decrypted CCM data structure
- The EasyDMA engine encounters an error, see [EasyDMA and ERROR event](#) on page 257

If the **IN.PTR** or **OUT.PTR** job lists do not end before the complete encrypted/decrypted CCM data structures are read, the **END** event is generated and CCM operation is stopped.

8.5.3 Encrypting packets in radio transmit mode

When the AES CCM is encrypting a packet at the same time as the radio is transmitting it, the radio must read the encrypted packet from the same memory location as the AES CCM is writing to.

The **OUT.PTR** pointer in the AES CCM must therefore point to the same memory location as the **PACKETPTR** pointer in the radio, see [Example configuration of encryption during radio transmission](#) on page 255.

Figure 48: Example configuration of encryption during radio transmission

The **START** task must be triggered by **RADIO READY** event to ensure that the payload is encrypted in time for radio transmission. This is illustrated in the following figure, using a PPI connection between **RADIO.EVENTS_READY** and **CCM.TASKS_START**.

Figure 49: Radio transmission with encryption using a PPI connection

8.5.4 Decrypting packets received by the radio

To decrypt a packet received by the radio immediately upon its reception, CCM can be started when the **RADIO PAYLOAD** event is generated. The packet is decrypted when the **CCM.END** event is generated. Typically, CCM will decrypt the packet before or during the reception of the CRC. However, if the packet is large and the bitrate is high, CCM will not finish before the **PHYEND** event, but shortly afterward. After the **CCM.END** event is generated; the **MACSTATUS** can be checked.

AES CCM must therefore operate on the same memory location as RADIO, as illustrated in the following figure.

Figure 50: Example configuration of CCM for decrypting a packet as it is received by the RADIO

8.5.5 CCM data structure

The input and output data structures are located in memory specified by **IN.PTR** and **OUT.PTR** on page 264 respectively.

Both **IN.PTR** and **OUT.PTR** point to a scatter/gather job list. This job list must contain all the fields listed in the attribute field table. Each job list must be terminated with a 0 filled job entry. If either of the **IN.PTR** or **OUT.PTR** job list is not terminated, then the behavior of CCM is undefined.

The job list consists of one or more job entries each containing a 32-bit address field, an 8-bit attribute field, and a 24-bit length field. A job list ends with a zero-filled job entry. The EasyDMA job list example below illustrates a job list that points to three different memory sections with varying lengths. The data pointed to by the job list is fed into the module to be processed according to the CCM operation. Job entries with a length greater than one byte are processed in little endian order.

Figure 51: EasyDMA job list example

The attribute field identifies the job and must be set according to the following table.

Attribute	Value
Alen	11
Mlen	12
Adata	13
Mdata	14

Table 40: Attribute field

8.5.6 EasyDMA and ERROR event

The CCM implements an EasyDMA with scatter/gather mechanism for reading and writing to memory.

In cases where the CPU and other EasyDMA enabled peripherals are accessing the same RAM block at the same time, a high level of bus collisions may cause too slow operation for correct on the fly encryption. In this case the ERROR event will be generated.

EasyDMA will have finished accessing the memory when the **END** event is generated.

If the **IN.PTR** and the **OUT.PTR** are not pointing to memory with DMA connectivity, an EasyDMA transfer may result in a HardFault or memory corruption. See **Memory** on page 13 for more information about the different memory regions.

For instances supporting DMA error detection, the **ERRORSTATUS** register will report if a bus error has occurred during DMA access.

8.5.7 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
CCM00 : S	GLOBAL	0x5004A000	US	S	SA	No	AES CCM mode encryption CCM00, running of HCLKCORE
CCM00 : NS		0x4004A000					

Configuration

Instance	Domain	Configuration
CCM00 : S	GLOBAL	Does not support on-the-fly decryption.
CCM00 : NS		

Register overview

Register	Offset	TZ	Description
TASKS_START	0x000		Start encryption/decryption. This operation will stop by itself when completed.
TASKS_STOP	0x004		Stop encryption/decryption
TASKS_RATEOVERRIDE	0x008		Override DATARATE setting in MODE register with the contents of the RATEOVERRIDE register for any ongoing encryption/decryption
SUBSCRIBE_START	0x080		Subscribe configuration for task START
SUBSCRIBE_STOP	0x084		Subscribe configuration for task STOP
SUBSCRIBE_RATEOVERRIDE	0x088		Subscribe configuration for task RATEOVERRIDE
EVENTS_END	0x104		Encrypt/decrypt complete or ended because of an error

Register	Offset	TZ	Description
EVENTS_ERROR	0x108		CCM error event
PUBLISH_END	0x184		Publish configuration for event END
PUBLISH_ERROR	0x188		Publish configuration for event ERROR
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
MACSTATUS	0x400		MAC check result
ERRORSTATUS	0x404		Error status
ENABLE	0x500		Enable
MODE	0x504		Operation mode
KEY.VALUE[n]	0x510		128-bit AES key
NONCE.VALUE[n]	0x520		13-byte NONCE vector
			Only the lower 13 bytes are used
IN.PTR	0x530		Input pointer
			Points to a job list containing unencrypted CCM data structure in Encryption mode
			Points to a job list containing encrypted CCM data structure in Decryption mode
OUT.PTR	0x538		Output pointer
			Points to a job list containing encrypted CCM data structure in Encryption mode
			Points to a job list containing decrypted CCM data structure in Decryption mode
RATEOVERRIDE	0x544		Data rate override setting.
ADATAMASK	0x548		CCM adata mask.

8.5.7.1 TASKS_START

Address offset: 0x000

Start encryption/decryption. This operation will stop by itself when completed.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

8.6 COMP — Comparator

The comparator peripheral (COMP) compares one input voltage (VIN+) against another input voltage (VIN-). VIN+ can be derived from an analog input pin (**AIN0** to **AIN7**). VIN- can be derived from multiple sources depending on the operation mode of the comparator.

The main features of COMP are the following:

- Input range from 0 V to VDD
- Single-ended mode
 - Fully flexible hysteresis using a 64-level reference ladder
- Differential mode
 - Configurable hysteresis
- Reference inputs (VREF)
 - External reference from **AIN0** to **AIN7** (between 0 V and VDD)
 - Internal VDD reference
 - 1.2 V internal reference
- Two speed/power consumption modes, low-power and high-speed
- Single-pin capacitive sensor support
- Event generation on output changes
 - UP event when VIN+ rises above VIN- (VIN+ > VIN-)
 - DOWN event when VIN+ falls below VIN- (VIN+ < VIN-)
 - CROSS event on VIN+ and VIN- crossing
 - READY event on core and internal reference (if used) ready

Figure 52: COMP overview

8.6.1 START and STOP tasks

Once enabled through register [ENABLE](#), COMP is started by triggering the START task and stopped by triggering the STOP task. COMP will generate a READY event to indicate when it is ready for use and the output is correct. The delay between START and READY is $t_{\text{INT_REF,START}}$ when an internal reference is selected, or $t_{\text{COMP,START}}$ if an external reference is used. When the COMP peripheral is started, events will be generated every time VIN+ crosses VIN-.

8.6.2 Operation modes

COMP can be configured to operate in the two main operation modes, differential mode and single-ended mode. See register [MODE](#) for more information. In both operation modes, COMP can operate in different speed and power consumption modes (low-power to high-speed). High-speed mode will consume more power compared to low-power mode. Low-power mode will result in a slower response time compared to high-speed mode.

Use register [PSEL](#) to select any of the **AIN[0 . . 7]** pins as the VIN+ input. The COMP operation mode does not matter. The source of VIN- depends on which operation mode is used.

- Differential mode – Derived directly from pins **AIN[0 . . 7]**.
- Single-ended mode – Derived from VREF. VREF can be derived from VDD, **AIN[0 . . 7]**, or internal 1.2 V reference.

The selected analog pins will be acquired by the comparator once it is enabled.

An optional hysteresis on VIN+ and VIN- can be enabled when the module is used in differential mode through the register [HYST](#). In single-ended mode, VUP and VDOWN thresholds can be set to implement

a hysteresis using the reference ladder (see [Comparator in single-ended mode](#) on page 269). This hysteresis is in the order of magnitude of $V_{DIFFHYST}$, and prevents noise on the signal to create unwanted events. See [Hysteresis example where VIN+ starts below VUP](#) on page 270 for an illustration of the effect of an active hysteresis on a noisy input signal.

An upward crossing will generate an UP event and a downward crossing will generate a DOWN event. The CROSS event will be generated every time there is a crossing, independent of direction.

The immediate value of the comparator can be sampled to register [RESULT](#) by triggering the SAMPLE task.

8.6.3 Current source on analog input

A selectable current can be applied through register [ISOURCE](#) on the selected AIN[n] line. Enabling the block creates a feedback path around the comparator, forming a relaxation oscillator. The circuit will sink current from VIN+ when the comparator output is high, and source current into VIN+ when the comparator output is low. The frequency of the oscillator is dependent on the capacitance at the analog input pin, the reference voltages, and the value of the current source. In this mode, only a capacitive sensor needs to be attached between the analog input pin and ground. With a selected current of 10 μA , VUP-VDOWN equal to 1 V, and an external capacity of typically 10 pF, the resulting oscillation frequency is around 500 kHz.

The frequency of the oscillator can be calculated as follows:

$$f_{OSC} = I_{SOURCE} / (2C \cdot (VUP - VDOWN))$$

8.6.4 Shared resources

The COMP shares analog resources with other analog peripherals.

Additionally, COMP shares registers and other resources with other peripherals that have the same ID as the COMP. See [Peripherals with shared ID](#) on page 229 for more information.

The COMP peripheral shall not be disabled (by writing to the ENABLE register) before the peripheral has been stopped. Failing to do so may result in unpredictable behavior.

8.6.5 Differential mode

In differential mode, the reference input VIN- is derived directly from one of the AINx pins.

Before enabling the comparator via the [ENABLE](#) register, the following registers must be configured for the differential mode:

- [PSEL](#)
- [MODE](#)
- [EXTREFSEL](#)

Figure 53: Comparator in differential mode

Note: Depending on the device, not all the analog inputs may be available for each MUX. See definitions for [PSEL](#) and [EXTREFSEL](#) for more information about which analog pins are available on a particular device.

When [HYST](#) register is turned on while in this mode, the output of the comparator (and associated events) will change from ABOVE to BELOW whenever V_{IN+} becomes lower than $V_{IN-} - (V_{DIFFHYST} / 2)$. It will also change from BELOW to ABOVE whenever V_{IN+} becomes higher than $V_{IN-} + (V_{DIFFHYST} / 2)$. This behavior is illustrated in [Hysteresis enabled in differential mode](#) on page 268.

Figure 54: Hysteresis enabled in differential mode

8.6.6 Single-ended mode

In single-ended mode, VIN- is derived from the reference ladder.

Before enabling the comparator via the **ENABLE** register, the following registers must be configured for the single-ended mode:

- **PSEL**
- **MODE**
- **REFSEL**
- **EXTREFSEL**
- **TH**

The reference ladder uses the reference voltage (VREF) to derive two new voltage references, VUP and VDOWN. VUP and VDOWN are configured using THUP and THDOWN respectively in the **TH** register. VREF can be derived from any of the available reference sources, configured using the **EXTREFSEL** and **REFSEL** registers as illustrated in [Comparator in single-ended mode](#) on page 269. When AREF is selected in the **REFSEL** register, the **EXTREFSEL** register is used to select one of the AIN0-AIN7 analog input pins as reference input. The selected analog pins will be acquired by the comparator once it is enabled.

Figure 55: Comparator in single-ended mode

Note: Depending on the device, not all the analog inputs may be available for each MUX. See definitions for **PSEL** and **EXTREFSEL** for more information about which analog pins are available on a particular device.

When the comparator core detects that $VIN+ > VIN-$, i.e. ABOVE as per the **RESULT** register, **VIN-** will switch to **VDOWN**. When **VIN+** falls below **VIN-** again, **VIN-** will be switched back to **VUP**. By specifying **VUP** larger than **VDOWN**, a hysteresis can be generated as illustrated in [Hysteresis example where VIN+ starts below VUP](#) on page 270 and [Hysteresis example where VIN+ starts above VUP](#) on page 270.

Writing to **HYST** has no effect in single-ended mode, and the content of this register is ignored.

Figure 56: Hysteresis example where $VIN+$ starts below VUP

Figure 57: Hysteresis example where $VIN+$ starts above VUP

8.7 ECB — AES electronic codebook mode encryption

The AES electronic codebook mode encryption (ECB) can be used for a range of cryptographic functions like hash generation, digital signatures, and keystream generation for data encryption/decryption. The ECB encryption block supports 128 bit AES encryption (encryption only, not decryption).

The main features of ECB are:

- 128-bit AES encryption
- Supports standard AES ECB block encryption
- Memory-to-memory operations using Scatter/Gather DMA

The inputs and outputs of the ECB are illustrated below.

Figure 58: ECB block diagram

AES ECB uses EasyDMA with scatter-gather to access to memory for in-place operations on cleartext and ciphertext during encryption. ECB uses the same AES core as the CCM and AAR blocks and is an asynchronous operation which may not complete if the AES core is busy.

AES ECB performs a 128 bit AES block encrypt. At the **START** task, cleartext is loaded into the ECB from memory described by the scatter/gather job list pointed to by INPTR and the ciphertext is written into memory described by the job list pointed to by OUTPTR. When the last cleartext byte has been encrypted and written to OUTPTR, the **END** event is triggered.

The following figure illustrates how the input and output job lists can be configured. For more details of the joblists, see [EasyDMA](#) on page 282.

Figure 59: Example job lists for ECB operation

The AES key is set by writing the **KEY.VALUE** key registers. The same key can be used to encrypt multiple blocks by triggering the **START** task multiple times.

AES ECB can be stopped by triggering the **STOP** task.

ECB only supports a single 16-byte block. For different job list sizes the following rules apply:

- If less than 16 bytes is supplied as input, then a PrematureInptrEnd error is triggered. The **EVENTS_ERROR** will also be set.
- If more than 16 bytes is supplied as input, then only the first 16 bytes are used.
- For an output job, only the number of bytes specified in the job list are copied to memory.

The 128-bit key in the **KEY.VALUE** registers is stored in reverse byte order relative to the payload. For example, using the sample calculation from the Bluetooth Core Specification v5.4, Volume 6, Part C, chapter 1.1, with the following data:

- Key: 4C68384139F574D836BCF34E9DFB01BF
- Plaintext: 0213243546576879acbdcedfe0f10213
- Expected Encrypted Output: 99ad1b5226a37e3e058e3b8e27c2c666

The **KEY.VALUE** registers are populated as follows:

- **KEY.VALUE[0]** = 0x9DFB01BF
- **KEY.VALUE[1]** = 0x36BCF34E

- `KEY.VALUE[2] = 0x39F574D8`
- `KEY.VALUE[3] = 0x4C683841`

The `IN.PTR` points to a job that contains the following 16-byte input data array:

```
{0x02, 0x13, 0x24, 0x35, 0x46, 0x57, 0x68, 0x79, 0xAC, 0xBD, 0xCE, 0xDF, 0xE0,
0xF1, 0x02, 0x13}
```

Once the encryption is complete, the output buffer referenced by the output job will be filled with the following 16-byte array:

```
{0x99, 0xAD, 0x1B, 0x52, 0x26, 0xA3, 0x7E, 0x3E, 0x05, 0x8E, 0x3B, 0x8E, 0x27,
0xC2, 0xC6, 0x66}
```

Note: The KEY byte order is reversed compared to the NRF52 and NRF53 series devices.

8.7.1 Shared resources

The ECB shares the same AES module as the AAR and CCM peripherals. The ECB will always have lowest priority. If there is a sharing conflict during encryption, the ECB operation will be aborted and an **ERROR** event will be generated.

8.7.2 EasyDMA

This peripheral implements EasyDMA with scatter-gather functionality for reading from and writing to memory without CPU involvement.

The scatter-gather functionality allows EasyDMA to collect data from multiple memory regions, instead of one contiguous block. The memory regions are described by a job list. The job list consists of one or more job entries that consist of a 32-bit address field, 8-bit attribute field, and 24-bit length field. A job list ends with a zero filled job entry. The attribute field must be set to 11.

If `INPTR` or `OUTPTR` pointers or the entries in the job lists are not pointing to memory connected to the DMA bus, an EasyDMA transfer may result in a HardFault or memory corruption. See [Memory](#) on page 13 for more information about the different memory regions and DMA connectivity.

The EasyDMA will have finished accessing the RAM when the **END** or **ERROR** events are generated.

For instances supporting DMA error detection, the **ERRORSTATUS** register will report if a bus error has occurred during DMA access. To see if DMA error detection is supported, see the the instance's configuration in [Instantiation](#) on page 232.

Example

The figure below shows an example of a job list with three job entries. Each of the entries point to a memory address, and the length field describes how many bytes of data is stored at that address. There are three blocks of memory in use

- `FIRSTDATA`, an array of length 3
- `SECONDDATA`, an array of length 2
- `THIRDDATA`, an array of length 11

The data pointed to from the job list is what is fed into the module and processed according to the peripheral's operation. The entries of the job list comprises pointers to the individual arrays, as well as their sizes. Job entries with length greater than one are processed in little endian order.

Figure 60: EasyDMA Scatter-Gather job list example

8.8 EGU — Event generator unit

Event generator unit (EGU) provides support for interlayer signaling. This means providing support for atomic triggering of both CPU execution and hardware tasks, from both firmware (by CPU) and hardware (by PPI). This feature can be used for triggering CPU execution at a lower priority execution from a higher priority execution, or to handle a peripheral's interrupt service routine (ISR) execution at a lower priority for some of its events. However, triggering any priority from any priority is possible.

Listed here are the main EGU features:

- Software-enabled interrupt triggering
- Separate interrupt vectors for every EGU instance
- Up to 16 separate event flags per interrupt for multiplexing

Each instance of EGU implements a set of tasks which can individually be triggered to generate the corresponding event. For example, the corresponding event for TASKS_TRIGGER[n] is EVENTS_TRIGGERED[n]. See [Instances](#) on page 289 for a list of EGU instances.

8.9 GPIO — General purpose input/output

The general purpose input/output (GPIO) pins are grouped as one or more ports, with each port having up to 32 GPIO pins.

The number of ports and GPIO pins per port varies with product variant and package. Refer to [Registers](#) on page 298 and [Pin assignments](#) on page 1219 for more information about the number of GPIO pins that are supported.

GPIO has the following user-configurable features:

- Configurable output drive strength
- Internal pull-up and pull-down resistors
- Wake-up from high or low level triggers on all pins in PER1 and LP power domains
- Trigger interrupt on state changes on any pin on selected ports, see the wakeup source capability in [Port capabilities](#) on page 295
- One or more GPIO outputs can be controlled through PPI and GPIOTE channels
- All pins can be individually mapped to interface blocks for layout flexibility
- GPIO state changes captured on SENSE signal can be stored by LATCH register
- Support for secure and non-secure attributes for pins in conjunction with the system protection unit ([SPU](#))

The following figure illustrates the GPIO port containing 32 individual pins, where `PIN0` is illustrated in more detail as a reference. All signals on the left side in the illustration are used by other peripherals in the system and therefore not directly available to the CPU.

8.9.1 Pin configuration

The following parameters can be enabled or configured in these registers:

- For more information on pin assignment and the corresponding effect of read and write operations of GPIO registers, see [Peripheral and subsystem assignment](#) on page 296.

NORDIC
SEMICONDUCTOR

8.9.2 Pin sense mechanism

Pin sensitivity can be individually configured through the SENSE field in the PIN_CNF[n] register to detect a high level or a low level on their input. When the correct level is detected, the sense mechanism will set the DETECT signal `high`. Each pin has a separate DETECT signal.

The default behavior for the DETECT signal is defined by the register `DETECTMODE`. By default, the DETECT signals from all pins in the GPIO port are combined into one common DETECT signal that is routed throughout the system, and can be utilized by other peripherals. This mechanism is functional in both System ON and System OFF modes. The `DETECTMODE` applies to both secure and non-secure pins.

Pins must be in a level that cannot trigger the sense mechanism before enabling it. When the sense mechanism is enabled, the DETECT signal will immediately go high if the SENSE condition configured in the PIN_CNF registers is met. This will trigger a PORT event if the DETECT signal was low before enabling the sense mechanism.

The DETECT signal is used by the power and clock management system to exit from System OFF mode, and by the GPIOTE peripheral to allow pins to generate events and interrupts.

When a pin's PINx.DETECT signal goes high, a flag will be set in the register `LATCH`. For example, when the PIN0.DETECT signal goes high, bit 0 in the register `LATCH` will be set to 1. If the CPU performs a clear operation on a bit in the register `LATCH` when the associated PINx.DETECT signal is high, the bit in the register `LATCH` will not be cleared. The register `LATCH` will only be cleared if the CPU explicitly clears it by writing a 1 to the bit to be cleared. This means the register `LATCH` will not be affected by a PINx.DETECT signal being set low.

The LATCH register has split security. Non-secure code can only read the state of the non-secure pins, while the secure pins read as 0. Secure code is able to read the state of all pins.

The LDETECT signal will be set high when one or more bits in the register `LATCH` are 1. The LDETECT signal will be set low when all bits in the register `LATCH` are successfully cleared to 0.

If one or more bits in the register `LATCH` are 1 after the CPU has performed a clear operation, a rising edge will be generated on the LDETECT signal. This is illustrated in [DETECT signal behavior](#) on page 295.

Note: The CPU can read the register `LATCH` at any time to check if a SENSE condition has been met on one or more of the GPIO pins. This is true even if that condition is no longer met at the time the CPU queries the register `LATCH`. This mechanism will work even if the LDETECT signal is not used as the DETECT signal.

LDETECT is enabled using the `DETECTMODE` register. See [GPIO port and the GPIO pin details](#) on page 293.

The following figure illustrates the DETECT signal behavior for these two alternatives.

Figure 62: DETECT signal behavior

8.9.3 Port capabilities

The device power domains have their own GPIO ports with different capabilities.

The following is a list of all GPIO ports (P[n]) in the system.

- P0 low-power domain – These I/O pins can wake the system up from System OFF or System ON sleep, and can be accessed by all peripherals in the low-power domain.
- P1 and P3 peripheral domain – These I/O pins can wake the system up from System OFF or System ON sleep, and can be accessed by all peripherals in the peripheral domain.
- P2 MCU domain – These I/O pins are faster and can be used for high-speed signals such as trace or fast serial peripheral communication. GPIO P2 cannot wake the system from sleep. P2 does not have the GPIO SENSE or DETECT mechanism, or GPIOTE.

Peripherals cannot mix pins from different ports. All pins must be on the same port.

The following table lists the port special functions and characteristics.

Port	Wakeup source	Extra high drive strength (E0E1)	Pin sense/ detect	GPIOTE	Maximum speed [MHz]
P0	Yes	No	Yes	Yes	8
P1	Yes	No	Yes	Yes	8
P2	No	Yes	No	No	64
P3	Yes	No	Yes	Yes	8

Table 41: Port capabilities

Please note that certain peripherals can operate the GPIOs at higher frequencies than those specified in the table above. In addition to the capabilities of the port, some specific pins have additional functions. These are listed in [Pin assignments](#) on page 1219.

8.9.4 Peripheral and subsystem assignment

System GPIO pins can be allocated to peripherals with dedicated pins or subsystems such as trace and debug.

The pins of the system are listed in [Pin assignments](#) on page 1219.

A pin can be assigned to any of the following:

- GPIO or peripheral with PSEL registers
- Peripheral with dedicated pins (VPR and GRTC)
- Trace and debug (TND) subsystem

By default, all pins are assigned to GPIO or peripherals with PSEL registers. This is the default value of the CTRLSEL value in register [PIN_CNF\[n\] \(n=0..31\) \(Retained\)](#) on page 302.

To allocate a pin to a peripheral or subsystem with dedicated pins, such as GRTC or TND, change the CTRLSEL value in register [PIN_CNF\[n\] \(n=0..31\) \(Retained\)](#) on page 302 for that pin. This will connect the pin to the subsystem or peripheral.

Only the peripheral or subsystem where the pin was allocated can observe and control that pin's state. Reading a pin that is not allocated to the current subsystem will return zero, and writes will be ignored. If a pin is allocated to a subsystem that cannot access it, the pin stays under control of the GPIO peripheral.

When CTRLSEL is used to allocate a peripheral or subsystem, reading the GPIO peripheral registers will not reveal the state of the pins.

The following figure illustrates how to assign a pin to a peripheral that has dedicated pins, or a subsystem such as trace and debug.

Figure 63: Pin access using CTRLSEL

For details on pin security, see [Security](#) on page 134.

Note: CTRLSEL must be configured before any pins are used, otherwise glitches on the GPIO pins of the corresponding port can occur.

8.9.5 Clock pins

The device has dedicated clock pins. Some peripherals, such as SPI, TWI, and TRACE, have clock signals.

The dedicated clock pins are optimized to ensure correct timing between the clock and data signals for these peripherals. All peripherals that have clock signals must use these pins. See [Pin assignments](#) on page 1219 for the full list.

The data signal associated with the peripheral must use pins close to the clock pin. This ensures that the internal paths from the peripheral to the pin have the same delay, so that the data and clock signals reach the pins at the same time.

For high-speed signals, the printed circuit board (PCB) layout must use short PCB traces of identical length. This reduces delays and ensures the same delay on the clock and data path.

8.9.6 Fast port control

`GPIOHSPADCTRL.BIAS.HSBIAS` configures the slew rate of the GPIO pins on P2 in the E0 and E1 drive mode.

A higher slew rate is mandatory for fast signal switching and timing accuracy, helping to maintain correct data transfer at higher speeds. A lower slew rate helps minimize EMI, signal overshoot, and noise.

The recommended setting is to always use the highest slew rate.

8.9.7 Reset behavior

While the **nRESET** pin is asserted (falling edge and held low), GPIO pins will enter one of two states:

- Retain their current configuration (e.g., outputs remain outputs, inputs remain inputs)
- Switch to high impedance, which is the default state upon device startup

Once **nRESET** is deasserted (rising edge), all GPIOs transition to the high impedance state until device firmware configures them.

When GPIO pins are in a high-impedance state for a prolonged period, external circuits that depend on a clearly defined logic level (either high or low) might require the use of external pull-up or pull-down resistors to ensure reliable operation. However, in most cases this is not required, as the duration of the high-impedance state during the reset cycle is typically very short.

8.10 GPIOTE — GPIO tasks and events

The GPIO tasks and events (GPIOTE) peripheral provides functionality for accessing GPIO pins using tasks and events. Each GPIOTE channel can be assigned to one pin.

The main features of GPIOTE are the following:

- GPIO pin state change by triggering tasks
- Event generation on GPIO pin state change
- PORT event generation on GPIO DETECT signal
- Support for split security on individual GPIOTE channels

A GPIOTE block enables GPIOs to generate events on pin state change which can be used to carry out tasks through the PPI system. A GPIO can also be driven to change state on system events using the PPI system. See [Peripheral interface](#) on page 228 for additional information on tasks and events. GPIO is described in more detail in [GPIO — General purpose input/output](#) on page 292.

Detection of pin state changes when in low power mode is possible when in System ON or System OFF.

GPIOTE supports split-security. Each channel is assigned a security state (S/NS).

Up to three tasks can be used in each GPIOTE channel for performing write operations to a pin. Tasks SET and CLR are fixed. OUT can be configured to perform following operations:

- Set
- Clear
- Toggle

An event can be generated in each GPIOTE channel from one of the following input conditions:

- Rising edge
- Falling edge
- Any change

8.10.1 Pin events and tasks

The GPIOTE module has a number of tasks and events that can be configured to operate on individual GPIO pins.

The tasks SET[n], CLR[n], and OUT[n] can write to individual pins, and events IN[n] can be generated from input changes of individual pins.

The SET task will set the pin selected in [CONFIG\[n\].PSEL](#) to high. The CLR task will set the pin low.

The effect of the OUT task on the pin is configurable in [CONFIG\[n\].POLARITY](#). It can set the pin high, set it low, or toggle it.

Tasks and events are configured using the [CONFIG\[n\]](#) registers. One [CONFIG\[n\]](#) register is associated with a set of SET[n], CLR[n], and OUT[n] tasks and IN[n] events.

As long as a SET[n], CLR[n], and OUT[n] task or an IN[n] event is configured to control pin **n**, the pin's output value will only be updated by the GPIOTE module. The pin's output value, as specified in the GPIO, will therefore be ignored as long as the pin is controlled by GPIOTE. Attempting to write to the pin as a normal GPIO pin will have no effect. When the GPIOTE is disconnected from a pin, the associated pin gets the output and configuration values specified in the GPIO module, see [MODE](#) field in [CONFIG\[n\]](#) register.

When conflicting tasks are triggered simultaneously (i.e. during the same clock cycle) in one channel, the priority of the tasks is as described in the following table.

Priority	Task
1	OUT
2	CLR
3	SET

Table 42: Task priorities

When setting the [CONFIG\[n\]](#) registers, [MODE](#)=Disabled does not have the same effect as [MODE](#)=Task and [POLARITY](#)=None. In the latter case, a CLR or SET task occurring at the exact same time as OUT will end up with no change on the pin, based on the priorities described in the table above.

When a GPIOTE channel is configured to operate on a pin as a task, the initial value of that pin is configured in the [OUTINIT](#) field of [CONFIG\[n\]](#).

8.10.2 Port event

PORT is an event that can be generated from multiple input pins using the GPIO DETECT signal.

The event will be generated on the rising edge of the DETECT signal. See [GPIO — General purpose input/output](#) on page 292 for more information about the DETECT signal.

There are two DETECT signals that come from the [GPIO](#) peripheral, the secure [DETECT_SEC](#) for pins marked as secure and the non-secure [DETECT_NONSEC](#). Each signal has a corresponding port event, [EVENTS_PORT\[n\].SECURE](#) and [EVENTS_PORT\[n\].NONSECURE](#). Secure events are not accessible from the non-secure side.

The GPIO DETECT signal will not wake the system up again if the system is put into System ON IDLE while the DETECT signal is high. Make sure to clear all DETECT sources before entering sleep. If the LATCH register is used as a source, a new rising edge will be generated on DETECT if any bit in LATCH is still high after clearing all or part of the register. This could occur if one of the [PINx.DETECT](#) signals is still high, for example. See [Pin sense mechanism](#) on page 294 for more information.

Setting the system to System OFF while DETECT is high will cause a wakeup from System OFF reset.

This feature can be used to wake up the CPU from a WFI or WFE type sleep in System ON when all peripherals and the CPU are idle, meaning the lowest power consumption in System ON mode.

In order to prevent spurious interrupts from the PORT event while configuring the sources, the following must be performed:

1. Disable interrupts on the PORT event (through [INTENCLR.PORT](#)).
2. Configure the sources ([PIN_CNF\[n\].SENSE](#) in [GPIO](#)).
3. Clear any potential event that could have occurred during configuration (write '0' to [EVENTS_PORT](#)).
4. Enable interrupts (through [INTENSET.PORT](#)).

8.10.3 Tasks and events pin configuration

Each GPIOTE channel is associated with one physical GPIO pin through the [CONFIG.PSEL](#) field.

When Event mode is selected in [CONFIG.MODE](#), the pin specified by [CONFIG.PSEL](#) will be configured as an input, overriding the [DIR](#) setting in [GPIO](#). Similarly, when Task mode is selected in [CONFIG.MODE](#), the pin specified by [CONFIG.PSEL](#) will be configured as an output overriding the [DIR](#) setting and [OUT](#) value in [GPIO](#). When Disabled is selected in [CONFIG.MODE](#), the pin specified by [CONFIG.PSEL](#) will use its configuration from the [PIN\[n\].CNF](#) registers in [GPIO](#).

For the range of possible [CONFIG.PORT](#) values in the product, see [Instances](#) on page 305. Writing other values may lead to undefined behavior.

Note: A pin can only be assigned to one GPIOTE channel at a time. Failing to do so may result in unpredictable behavior.

8.10.4 Split security attribute

Individual GPIOTE channels and interrupts can have independent security attributes.

GPIOTE is implemented with split security, meaning it handles accesses from both secure and non-secure code. GPIOTE channels and interrupts can be defined as secure or non-secure.

For more information on GPIOTE security attributes, see [GPIOTE](#) on page 143.

8.10.5 Registers

8.10.5.15 CONFIG[n] (n=0..7)

Configuration for OUT[n], SET[n], and CLR[n] tasks and IN[n] event

4539 001 v1.0

8.11 GRTC — Global real-time counter

The global real-time counter peripheral (GRTC) is an ultra-low power shared system timer. GRTC implements a high-resolution system timer that is available in all power modes, including System OFF.

The system timer has a 1 μ s resolution and is 52 bits wide. This provides a run time of 142 years after initial power-on until the counter wraps around. It uses the 16 MHz clock when the high-speed clock is active, but automatically switches to 32.768 kHz in the other power modes. It will continue to be updated in all power modes. Due to the combination of clock sources, it has a 1 μ s resolution and an accuracy equal to the 32.768 kHz clock.

The main features of GRTC are the following:

- System timer – SYSCOUNTER
 - 1 μ s resolution
 - Multiple compare/capture channels on SYSCOUNTER
 - PPI connection
 - Periodic interval generation for one compare event
 - Wake up from System OFF mode
 - Supports split security for GRTC features
- Pulse Width Modulation (PWM)
 - Single channel PWM
 - Operates in System OFF mode
- Clock output on pin
 - LFCLK
 - Configurable divided fast clock output

The system timer is a high resolution timer which can be accessed by all processors in the system. It allows the same system counter to be shared among all users. GRTC can operate in System OFF mode.

Figure 64: GRTC block diagram

The internal low-frequency timer can run while in System OFF mode.

All GRTC registers are reset during wakeup from System OFF mode. However, the `SYSCOUNTER[m].SYSCOUNTERL` and `SYSCOUNTER[m].SYSCOUNTERH` registers are restored automatically on wakeup from System OFF mode and after soft reset.

8.11.1 GRTC clock sources

The low frequency timer in GRTC will run off the LFCLK.

When the low frequency timer is started, the GRTC peripheral will automatically request the LFCLK source if the LFCLK is not already running.

The GRTC low frequency timer clock source can be selected using register [CLKCFG.CLKSEL](#). The clock source cannot be changed after GRTC is started.

The clock source selection at GRTC is retained internally during System OFF mode, even though the [CLKCFG.CLKSEL](#) is reset on wakeup.

The SYSCOUNTER runs off the fast clock (16MHz clock), but uses only LFCLK while SYSCOUNTER is in sleep state.

See [CLOCK](#) for more information about clock sources.

8.11.2 SYSCOUNTER

The internal counter at SYSCOUNTER increments every 1 μ s.

SYSCOUNTER is a 52-bit counter and is enabled using [MODE.SYSCOUNTEREN](#) register. The internal low frequency timer must be started for the proper operation of the SYSCOUNTER while SYSCOUNTER goes into sleep mode. It can be started by the [TASKS_START](#) task and can be stopped by the [TASKS_STOP](#) task when SYSCOUNTER is no more in use.

There are [m] registers [SYSCOUNTER\[m\]](#) providing access to SYSCOUNTER for each security attribute.

The current value of SYSCOUNTER can be read using corresponding [SYSCOUNTER\[m\].SYSCOUNTERL](#) and [SYSCOUNTER\[m\].SYSCOUNTERH](#). But, the [SYSCOUNTER\[m\].SYSCOUNTERL](#) must be read before corresponding [SYSCOUNTER\[m\].SYSCOUNTERH](#). The [SYSCOUNTER\[m\].SYSCOUNTERH.OVERFLOW](#) indicates if the [SYSCOUNTER\[m\].SYSCOUNTERL](#) is overflown after reading it.

Sample code for reading the SYSCOUNTER value:

```
uint32_t syscounterl_value, syscounterh_value, syscounterh;
uint64_t syscounter;

do
{
    syscounterl_value = GRTC.SYSCOUNTER[m].SYSCOUNTERL;
    syscounterh = GRTC.SYSCOUNTER[m].SYSCOUNTERH;

    syscounterh_value = ((syscounterh & GRTC_SYSCOUNTER_SYSCOUNTERH_VALUE_Msk) >>
GRTC_SYSCOUNTER_SYSCOUNTERH_VALUE_Pos);

    if (((syscounterh & GRTC_SYSCOUNTER_SYSCOUNTERH_OVERFLOW_Msk) >>
GRTC_SYSCOUNTER_SYSCOUNTERH_OVERFLOW_Pos) ==
GRTC_SYSCOUNTER_SYSCOUNTERH_OVERFLOW_Overflow)
    {
        syscounterh = syscounterh_value - 1;
    }

} while (((syscounterh & GRTC_SYSCOUNTER_SYSCOUNTERH_BUSY_Msk) >>
GRTC_SYSCOUNTER_SYSCOUNTERH_BUSY_Pos) != GRTC_SYSCOUNTER_SYSCOUNTERH_BUSY_Ready);

syscounter = (syscounterh_value << 32) + syscounterl_value;
```

Compare and Capture (CC)

The **CC[n]** is a group of registers interfacing the compare and capture channels of SYSCOUNTER, where *n* is the number of compare and capture channels specified in the GRTC instance configuration table below. Each **CC[n]** has an associated **TASKS_CAPTURE[n]** task and **EVENTS_COMPARE[n]** event. Each channel compare functionality can be enabled/disabled with **CC[n].CCEN.ACTIVE**, and its current active state read from this same register.

The **EVENTS_COMPARE[n]** event can be generated by writing the compare values to the corresponding **CC[n].CCL** and **CC[n].CCH** registers. When a channel compare functionality is enabled and SYSCOUNTER is equal or greater than that CC value **EVENTS_COMPARE[n]** will be generated. Writes to **CC[n].CCL** disable the corresponding compare channel and writes to **CC[n].CCH** enable it. So **CC[n].CCL** must be written first.

Each channel compare functionality, except for the first channel when operating in periodic mode, operates in one-shot mode. When operating in one-shot mode, **CC[n].CCEN.ACTIVE** is cleared automatically following a compare event.

Moreover, a compare channel is automatically disabled when triggering **TASKS_CAPTURE[n]**.

The **EVENTS_COMPARE[n]** event is generated immediately if the configured compare value at **CC[n]** is less than the current SYSCOUNTER value. The status **CC[n].CCEN.PASTCC** indicates this condition.

Every time the **TASKS_CAPTURE[n]** task is triggered, the current SYSCOUNTER is copied into the corresponding **CC[n].CCL** and **CC[n].CCH** registers. The **CC[n].CCL** and **CC[n].CCH** registers can be read in any order. The **TASKS_CAPTURE[n]** task will not generate **EVENTS_COMPARE[n]** event.

The **TASKS_CAPTURE[n]** tasks and **EVENTS_COMPARE[n]** events can be connected with the PPI. However, the **TASKS_CAPTURE[n]** is functional only when the SYSCOUNTER is in active state. The GRTC can be forced into active state by setting any **SYSCOUNTER[n].ACTIVE** register.

The compare value for `CC[n]` can also be updated by adding a fixed value provided at `CC[n].CCADD.VALUE`. Based on the `CC[n].CCADD.REFERENCE` configuration, either the current CC value or the current SYSCOUNTER value is added to the `CC[n].CCADD.VALUE` to configure the new compare value. Writing to `CC[n].CCADD` enables the corresponding compare channel.

Writes to `CC[n].CCADD` are ignored when the SYSCOUNTER is in sleep state.

Periodic interval

In addition to one-shot mode, the `CC[0]` can produce periodic `EVENTS_COMPARE[0]` event without any software interaction. The interval between these events can be programmed using `INTERVAL` register and non-zero interval enables this periodic interval feature. On every `EVENTS_COMPARE[0]` event, `CC[0]` becomes `CC[0] + INTERVAL`.

SYSCOUNTER sleep mode

SYSCOUNTER supports the following power modes:

- SYSCOUNTER is in active state
- SYSCOUNTER is in sleep state - This is the GRTC ultra-low power sleep mode

To save power, SYSCOUNTER automatically goes into sleep state when there is no activity.

Before SYSCOUNTER goes into sleep state, the GRTC configures the internal low frequency timer compare match based on the next expected SYSCOUNTER compare match using `CC[n]` configuration. An internal event on low frequency timer is generated when the compare match happens.

The internal counter at SYSCOUNTER is not ticking when SYSCOUNTER is in sleep state, the internal low frequency timer is configured as described above.

SYSCOUNTER returns to active state when any one of the following condition is met,

- Any of `SYSCOUNTER[n].ACTIVE` register is set to Active
- SYSCOUNTER counter value is read
- Any of the following registers are written:
 - `MODE`
 - `CC[n]`
 - `INTENn/INTENSETn/INTENCLRn/INTENPENDn`
 - Write to tasks `TASKS_START`, `TASKS_STOP` and `TASKS_CLEAR`
 - When internal low frequency timer compare match happens
- Any CPU is not sleeping, if `MODE.AUTOEN` is set

SYSCOUNTER goes back into sleep state when none of the above conditions met. However, the SYSCOUNTER active state can be extended by configuring the number of LFCLK cycles at `TIMEOUT` register.

On wake up to active state, SYSCOUNTER is updated based on the internal low frequency timer compare match. The status `SYSCOUNTER[m].SYSCOUNTERH.BUSY` indicates SYSCOUNTER is synchronized and valid after the SYSCOUNTER is woken up.

The status `SYSCOUNTER[m].SYSCOUNTERH.LOADED` indicates SYSCOUNTER is loaded after wake up, but not synchronized to the low frequency clock yet. This gives early indication of the SYSCOUNTER value, which may vary approximately one low frequency clock cycle.

The SYSCOUNTER status can be summarized as below:

- `SYSCOUNTER[m].SYSCOUNTERH.BUSY = 1` and `SYSCOUNTER[m].SYSCOUNTERH.LOADED = 0` : SYSCOUNTER is in sleep and `SYSCOUNTER[m].SYSCOUNTER` value is invalid

- `SYSCOUNTER[m].SYSCOUNTERH.BUSY = 1` and `SYSCOUNTER[m].SYSCOUNTERH.LOADED = 1` :
SYSCOUNTER is in woken up and `SYSCOUNTER[m].SYSCOUNTER` value is updated but not synchronized to low frequency clock yet
- `SYSCOUNTER[m].SYSCOUNTERH.BUSY = 0` and `SYSCOUNTER[m].SYSCOUNTERH.LOADED = 1` :
`SYSCOUNTER[m].SYSCOUNTER` value is valid

Before handling next scheduled `EVENTS_COMPARE[n]` event, GRTC must wake up from the low power state. The `WAKETIME` register configures the number of LFCLK cycles that GRTC will wake up before the compare event. This duration allows the device sufficient time to power up, initialize, and activate the necessary clocks to accurately generate and handle events from the GRTC SYSCOUNTER. A longer system wake-up time requires a larger `WAKETIME` value to ensure reliable event processing. When the device is in System OFF, the `WAKETIME` must cover the system wakeup time from System OFF mode and in addition the required time the system uses to configure GRTC and enable the event.

All GRTC registers must be restored at wakeup from system OFF before the next scheduled `COMPARE[n]` event is generated. The `TIMEOUT` register must be configured to a value higher than `WAKETIME` (`TIMEOUT > WAKETIME + guard_time`). This makes sure that GRTC is not entering sleep again if the next event is nearer than `TIMEOUT` LFCLK cycles. The minimum guard time is 1 LFCLK cycle.

Recommendation on reading SYSCOUNTER

The following steps are recommended while reading SYSCOUNTER:

1. Set the corresponding `SYSCOUNTER[m].ACTIVE` to Active
2. Wait until the corresponding status `SYSCOUNTER[m].SYSCOUNTERH.BUSY` is cleared
3. Read the corresponding `SYSCOUNTER[m].SYSCOUNTERL/H` values
4. Clear the `SYSCOUNTER[m].ACTIVE` set above

Entering System OFF mode

The following steps are recommended before entering System OFF mode:

1. Set the SYSCOUNTER in active state, either
 - Set `MODE.AUTOEN`
 - Set corresponding `SYSCOUNTER[m].ACTIVE` to Active
2. If GRTC is wakeup source, then set the corresponding `CC[n]` value to expected wakeup time
3. Set `WAKETIME` for the boot latency
4. Set the SYSCOUNTER in sleep state, by clearing the configuration set at step 1 above
5. Wait for either of `EVENTS_RTCOMPARESYNC` or any `EVENTS_COMPARE[n]`
 - If any `EVENTS_COMPARE[n]` triggered,
 - a. Allow CPUs to wakeup on interrupts
 - b. Do not enter System OFF mode
 - Else,
 - a. Enter System OFF by using the `SYSTEMOFF` register

8.11.3 Pulse Width Modulation (PWM)

The GRTC peripheral has a built-in PWM that can drive one output pin as an 8-bit non-inverted pulse-width modulated output.

The PWM is based on the internal low frequency timer of the GRTC and the PWM has a period of 256 LFCLK clock cycles, resulting frequency is 128Hz.

The PWM can be started by the `TASKS_PWMSTART` task and can be stopped by the `TASKS_PWMSTOP` task. The PWM starts/stops on next time when the lower 8 bits of internal low frequency timer becomes to zero. It takes up to 256 LFCLK clock cycles to take these tasks to go into effect.

The `STATUS.PWM.READY` indicates busy while handling the tasks `TASKS_PWMSTART` and `TASKS_PWMSTOP`. These PWM tasks must be triggered only when the `STATUS.PWM.READY` status indicates ready. The `EVENTS_PWMREADY` event is generated when the `STATUS.PWM.READY` status changes from busy to ready.

The PWM compare value is configured using `PWMCONFIG` and the copied to the internal PWM compare register when the lower 8 bits of internal low frequency timer is 0.

The PWM output goes high when the the lower 8 bits of internal low frequency timer goes to zero and the PWM output goes low when the lower 8 bits of internal low frequency timer matches the PWM compare value. The `EVENTS_PWMPERIODEND` event is generated on the rising edge of the PWM output.

To optimize the GRTC power consumption, the `EVENTS_PWMPERIODEND` can be disabled using `EVTEN/EVTENSET/EVTENCLR` registers to prevent clock from being requested when those events are triggered.

The PWM is operating even while the device is in system OFF.

For the PWM output pin mapping, see [Pin assignments](#) on page 1219. GRTC uses standard output drive strength for PWM output.

8.11.4 Clock output

The GRTC can be configured to output the clock on a pin.

The following clocks can be configured to be output on pins:

- LFCLK (32 KHz clock) output
- Divided 16M Hz clock (fast clock) output

The clock outputs can be enabled or disabled using `CLKOUT`.

The 16 MHz clock is divided before it is output on a pin. The divisor can be configured in `CLKCFG`, where clock output is (fast clock) / (`CLKCFG.CLKFASTDIV` * 2). The `CLKCFG.CLKFASTDIV` should be changed only when `CLKOUT.CLKOUTFAST` is disabled.

When updating the configuration registers `CLKCFG` and `CLKOUT`, a delay of a few LFCLK cycles may occur before the configuration takes effect. The `STATUS.CLKOUT.READY` register indicates whether the GRTC is busy updating the configuration:

- Busy: Configuration is in progress.
- Ready: Safe to update configuration.

Always check `STATUS.CLKOUT.READY` before making changes to `CLKCFG` or `CLKOUT`. The `EVENTS_CLKOUTREADY` event is generated when the `STATUS.CLKOUT.READY` status changes from busy to ready.

The LFCLK clock is output also when the device is in System OFF mode.

For the clock output pin mapping, see [Pin assignments](#) on page 1219. GRTC uses standard output drive strength for clock output.

8.11.5 Split Security

The GRTC peripheral supports split security, where the split security features can have different security attributes than the GRTC peripheral.

Split security settings are configured in `SPU`.

The following GRTC features have split security attributes:

- Each compare/capture channel at [CC\[n\]](#) register group - The same security attribute applies to the corresponding channels for,
 - [TASKS_CAPTURE\[n\]](#)
 - [SUBSCRIBE_CAPTURE\[n\]](#)
 - [EVENTS_COMPARE\[n\]](#)
 - [PUBLISH_COMPARE\[n\]](#)
- Each [INTENm/INTENSETm/INTENCLRm/INTENPENDm](#) - The same security attribute applies to the following registers
 - [SYSCOUNTER\[m\]](#)
- Registers, tasks, and events associated with the PWM function have configurable security attribute.
 - [PWMCONFIG](#)
 - [TASKS_PWMSTART](#)
 - [TASKS_PWMSTOP](#)
 - [EVENTS_PWMPERIODEND](#)
 - [EVENTS_PWMREADY](#)
 - [PUBLISH_PWMREADY](#)
 - [STATUS.PWM](#)
- Registers, tasks, and events associated with the CLKOUT and CLKCFG functions have configurable security attribute.
 - [CLKOUT](#)
 - [CLKCFG](#)
 - [EVENTS_CLKOUTREADY](#)
 - [PUBLISH_CLKOUTREADY](#)
 - [STATUS.CLKOUT](#)

[INTERVAL](#) has same security attribute as the [CC\[0\]](#) register group.

For more information on GRTC split ownership and security attributes, see [Split Security](#) on page 318.

Interrupts

GRTC provides multiple interrupts. Each interrupt is associated with its own set of [INTENm/INTENSETm/INTENCLRm/INTENPENDm](#) register. All events are routed to each of [INTENm/INTENSETm/INTENCLRm/INTENPENDm](#) registers, however only those events matching the security attributes can be accessible using the [INTENm/INTENSETm/INTENCLRm/INTENPENDm](#) registers.

8.11.6 Task priority

If the START task and the STOP task are triggered at the same time, meaning within the same period of LFCLK, the STOP task is prioritized.

If one or more of the CAPTURE tasks and the CLEAR task are triggered at the same time, that is, within the same period of LFCLK, the CAPTURE tasks are prioritized. This means that the CC registers will capture the counter value before the CLEAR tasks are triggered.

The [STATUS.LFTIMER.READY](#) indicates busy while handling the tasks [TASKS_START](#), [TASKS_STOP](#) and [TASKS_CLEAR](#). These tasks must be triggered only when the [STATUS.LFTIMER.READY](#) status indicates ready.

8.11.7 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description

		4 interrupts with interrupt remapping
		12 capture compare channels implemented

Register overview

Register	Offset	TZ	Description
TASKS_CAPTURE[n]	0x000		Capture the counter value to CC[n] register
TASKS_START	0x060		Start the counter
TASKS_STOP	0x064		Stop the counter
TASKS_CLEAR	0x068		Clear the counter
TASKS_PWMSTART	0x06C		Start the PWM
TASKS_PWMSTOP	0x070		Stop the PWM
SUBSCRIBE_CAPTURE[n]	0x080		Subscribe configuration for task CAPTURE[n]
EVENTS_COMPARE[n]	0x100		Compare event on CC[n] match
EVENTS_RTCOMPARESYNCH	0x164		The GRTC low frequency timer is synchronized with the SYS_COUNTER
EVENTS_PWMPERIODEND	0x16C		Event on end of each PWM period
EVENTS_PWMREADY	0x174		Event on STATUS.PWM.READY status changed to ready

Register	Offset	TZ	Description
EVENTS_CLKOUTREADY	0x178		Event on STATUS.CLKOUT.READY status changed to ready
PUBLISH_COMPARE[n]	0x180		Publish configuration for event COMPARE[n]
PUBLISH_PWMREADY	0x1F4		Publish configuration for event PWMREADY
PUBLISH_CLKOUTREADY	0x1F8		Publish configuration for event CLKOUTREADY
SHORTS	0x200		Shortcuts between local events and tasks
INTEN0	0x300		Enable or disable interrupt
INTENSET0	0x304		Enable interrupt
INTENCLR0	0x308		Disable interrupt
INTPEND0	0x30C		Pending interrupts
INTEN1	0x310		Enable or disable interrupt
INTENSET1	0x314		Enable interrupt
INTENCLR1	0x318		Disable interrupt
INTPEND1	0x31C		Pending interrupts
INTEN2	0x320		Enable or disable interrupt
INTENSET2	0x324		Enable interrupt
INTENCLR2	0x328		Disable interrupt
INTPEND2	0x32C		Pending interrupts
INTEN3	0x330		Enable or disable interrupt
INTENSET3	0x334		Enable interrupt
INTENCLR3	0x338		Disable interrupt
INTPEND3	0x33C		Pending interrupts
EVTEN	0x400		Enable or disable event routing
EVTENSET	0x404		Enable event routing
EVTENCLR	0x408		Disable event routing
MODE	0x510		Counter mode selection
CC[n].CCL	0x520		The lower 32-bits of Capture/Compare register CC[n]
CC[n].CCH	0x524		The higher 32-bits of Capture/Compare register CC[n]
CC[n].CCADD	0x528		Count to add to CC[n] when this register is written.
CC[n].CCEN	0x52C		Configure Capture/Compare register CC[n]
TIMEOUT	0x6A4		Timeout after all CPUs gone into sleep state to stop the SYSCOUNTER
INTERVAL	0x6A8		Count to add to CC[0] when the event EVENTS_COMPARE[0] triggers.
WAKETIME	0x6AC		GRTC wake up time.
STATUS.LFTIMER	0x6B0		Low frequency timer status.
STATUS.PWM	0x6B4		PWM status.
STATUS.CLKOUT	0x6B8		CLKOUT configuration status.
PWMCONFIG	0x710		PWM configuration.
CLKOUT	0x714		Configuration of clock output
CLKCFG	0x718		Clock Configuration
SYSCOUNTER[n].SYSCOUNTERL	0x720		The lower 32-bits of the SYSCOUNTER for index [n]
SYSCOUNTER[n].SYSCOUNTERH	0x724		The higher 20-bits of the SYSCOUNTER for index [n]
SYSCOUNTER[n].ACTIVE	0x728		Request to keep the SYSCOUNTER in the active state and prevent going to sleep for index [n]

8.11.7.1 TASKS_CAPTURE[n] (n=0..11)

Address offset: $0x000 + (n \times 0x4)$

Capture the counter value to CC[n] register

8.12 LPCOMP — Low-power comparator

The low-power comparator (LPCOMP) peripheral compares an input voltage against a reference voltage.

The main features of LPCOMP are the following:

- Input range of 0 to VDD
- Ultra-low power
- Eight input options (**AIN0** to **AIN7**)
- Two reference voltage options:
 - Two external analog reference inputs
 - 15-level internal reference ladder (VDD/16)
- Optional hysteresis enable on input
- Wakeup source from System OFF or System ON IDLE

In System ON, LPCOMP can generate separate events on rising and falling edges of a signal, or sample the current state of the pin to determine if it is above or below the selected reference. The block is configurable to use any of the analog inputs on the device. Additionally, LPCOMP can be used as an analog wakeup source from System ON IDLE or System OFF. The comparator threshold is programmable to a range of supply voltage fractions.

Note: LPCOMP cannot be used (STARTed) at the same time as COMP. Only one comparator can be used at a time.

Figure 65: LPCOMP block diagram

8.12.1 Operation

The LPCOMP peripheral compares an input voltage (VIN+) from an analog input pin selected via the PSEL register, against a reference voltage (VIN-) selected via registers [REFSEL](#) on page 351 and [EXTREFSEL](#).

The [PSEL](#), [REFSEL](#), and [EXTREFSEL](#) registers must be configured before LPCOMP is enabled through the [ENABLE](#) register.

The [HYST](#) register allows enabling an optional hysteresis in the comparator core. This hysteresis prevents noise on the signal, which would create unwanted events. The following figure illustrates the effect of an active hysteresis on a noisy input signal. It is disabled by default, and must be configured before enabling LPCOMP.

Figure 66: Effect of hysteresis on a noisy input signal

LPCOMP is started by triggering the START task. After a startup time of $t_{\text{LPCOMP,STARTUP}}$, LPCOMP generates a READY event to indicate that the comparator is ready to use and the output of LPCOMP is correct. LPCOMP generates events every time $V_{\text{IN}+}$ crosses $V_{\text{IN}-}$. More specifically, every time $V_{\text{IN}+}$ rises above $V_{\text{IN}-}$ (upward crossing), an UP event and CROSS event are generated. Every time $V_{\text{IN}+}$ falls below $V_{\text{IN}-}$ (downward crossing), a DOWN event and CROSS event are generated. When hysteresis is enabled, the upward crossing level becomes $V_{\text{IN}-} + V_{\text{HYST}}/2$, and the downward crossing level becomes $V_{\text{IN}-} - V_{\text{HYST}}/2$.

LPCOMP is stopped by triggering the STOP task.

LPCOMP is operational in both System ON and System OFF mode when enabled through the [ENABLE](#) register. See [POWER — Power control](#) on page 100 for more information about power modes. Entering System OFF is not allowed when a READY event is pending to be generated.

All LPCOMP registers, including [ENABLE](#), are classified as retained registers when the LPCOMP is enabled. However, when the device wakes up from System OFF, all LPCOMP registers are reset.

LPCOMP can wake up the system from System OFF by asserting the ANADETECT signal. The ANADETECT signal can be derived from any of the event sources that generate UP, DOWN, and CROSS events. If wakeup from System OFF occurs, only the ANADETECT signal is generated. See the ANADETECT register ([ANADETECT](#) on page 351) for more information on configuring the ANADETECT signal.

The immediate value of the LPCOMP can be sampled to [RESULT](#) on page 350 by triggering the SAMPLE task.

See [RESETREAS](#) on page 112 for more information on how to detect a wakeup from LPCOMP.

8.12.2 Shared resources

LPCOMP shares analog resources with SAADC. While it is possible to use the SAADC at the same time as the LPCOMP, selecting the same analog input pin for both modules is not supported.

Additionally, LPCOMP shares registers and other resources with other peripherals that have the same ID as the LPCOMP. See [Peripherals with shared ID](#) on page 229 for more information.

The LPCOMP peripheral should not be disabled (by writing to the ENABLE register) before the peripheral has stopped. Failing to do so may result in unpredictable behavior.

8.12.3 Pin configuration

The LPCOMP.PSEL register is used to select an analog input pin for LPCOMP. The pins available are **AIN0** through **AIN7**.

See [GPIO — General purpose input/output](#) on page 292 for more information about the pins. Similarly, you can use [EXTREFSEL](#) on page 351 to select one of the analog reference input pins, **AIN0** and **AIN1**, as input for AREF if it is selected in [EXTREFSEL](#) on page 351. The selected analog pins are acquired by LPCOMP when it is enabled through [ENABLE](#) on page 350.

8.12.4 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
LPCOMP : S	GLOBAL	0x50106000	US	S	NA	No	Low-power comparator LPCOMP
LPCOMP : NS		0x40106000					

Register overview

Register	Offset	TZ	Description
TASKS_START	0x000		Start comparator
TASKS_STOP	0x004		Stop comparator
TASKS_SAMPLE	0x008		Sample comparator value. This task requires that LPCOMP has been started by the START task.
SUBSCRIBE_START	0x080		Subscribe configuration for task START
SUBSCRIBE_STOP	0x084		Subscribe configuration for task STOP
SUBSCRIBE_SAMPLE	0x088		Subscribe configuration for task SAMPLE
EVENTS_READY	0x100		LPCOMP is ready and output is valid
EVENTS_DOWN	0x104		Downward crossing
EVENTS_UP	0x108		Upward crossing
EVENTS_CROSS	0x10C		Downward or upward crossing
PUBLISH_READY	0x180		Publish configuration for event READY
PUBLISH_DOWN	0x184		Publish configuration for event DOWN
PUBLISH_UP	0x188		Publish configuration for event UP
PUBLISH_CROSS	0x18C		Publish configuration for event CROSS
SHORTS	0x200		Shortcuts between local events and tasks
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
RESULT	0x400		Compare result
ENABLE	0x500		Enable LPCOMP
PSEL	0x504		Input pin select
REFSEL	0x508		Reference select
EXTREFSEL	0x50C		External reference select
ANADETECT	0x520		Analog detect configuration
HYST	0x538		Comparator hysteresis enable

8.13 NFCT — Near field communication tag

The NFCT peripheral is an implementation of an NFC Forum compliant listening device NFC-A.

The main features of NFCT are the following:

- NFC-A listen mode operation:
 - 13.56 MHz input frequency
 - Bit rate 106 kbps
- Wake-on-field low power field detection (SENSE) mode
- Frame assemble and disassemble for the NFC-A frames specified by the NFC Forum
- Programmable frame timing controller
- Integrated automatic collision resolution, cyclic redundancy check (CRC), and parity functions

With appropriate software, the NFCT peripheral can be used as the listening device NFC-A as specified by the [NFC Forum](#).

Figure 67: NFCT block diagram

8.13.1 Overview

The NFCT peripheral contains a 13.56 MHz AM receiver and a 13.56 MHz load modulator with 106 kbps data rate as defined by the NFC Forum.

Figure 68: NFCT overview

When transmitting, the frame data will be transferred directly from RAM and transmitted with configurable frame type and delay timing. The system will be notified by an event whenever a complete frame is received or sent. The received frames will be automatically disassembled and the data part of the frame transferred to RAM.

The NFCT peripheral also supports the collision detection and resolution ("anticollision") as defined by the NFC Forum.

Wake-on-field is supported in SENSE mode while the device is either in System OFF or System ON mode. When the antenna enters an NFC field, an event will be triggered notifying the system to activate the NFCT functionality for incoming frames. In System ON, if the energy detected at the antenna increases beyond a threshold value, the module will generate a **FIELDDETECTED** event. When the strength of the field no longer supports NFC communication, the module will generate a **FIELDLOST** event. For the Low Power Field Detect threshold values, refer to **NFCT Electrical Specification** on page 1260.

In System OFF, the NFCT Low Power Field Detect function can wake the system up through a reset. See **RESETREAS** on page 112 for more information on how to detect a wakeup from NFCT.

If the system is put into System OFF mode while a field is already present, the NFCT Low Power Field Detect function will wake the system up right away and generate a reset.

Note: As a consequence of a reset, NFCT is disabled, and therefore the reset handler will have to activate NFCT again and set it up properly.

The HFXO must be running before the NFCT peripheral goes into ACTIVATED state. Note that the NFCT peripheral calibration is automatically done on **ACTIVATE** task. The HFXO can be turned off when the NFCT peripheral goes into SENSE mode. The shortcut **FIELDDETECTED_ACTIVATE** can be used when the HFXO is already running while in SENSE mode.

Outgoing data will be collected from RAM with the EasyDMA function and assembled according to the **TXD.FRAMECONFIG** register. Incoming data will be disassembled according to the **RXD.FRAMECONFIG** register and the data section in the frame will be written to RAM via the EasyDMA function.

The NFCT peripheral includes a frame timing controller that can be used to accurately control the inter-frame delay between the incoming frame and a corresponding outgoing frame. It also includes optional CRC functionality.

8.13.2 Operating states

Tasks and events are used to control the operating state of the peripheral. The module can change state by triggering a task, or when specific operations are finalized. Events and tasks allow software to keep track of and change the current state.

See [NFCT block diagram](#) on page 353 and [NFCT state diagram, automatic collision resolution enabled](#) on page 355 for more information. See *NFC Forum, NFC Activity Technical Specification* for description on NFCT operating states.

Figure 69: NFCT state diagram, automatic collision resolution enabled

Figure 70: NFCT state diagram, automatic collision resolution disabled

Important:

- FIELDLOST event is not generated in SENSE mode.
- Sending SENSE task while field is still present does not generate **FIELDDETECTED** event.
- If the FIELDDETECTED event is cleared before sending the **ACTIVATE** task, then the FIELDDETECTED event shows up again after sending the ACTIVATE task. The shortcut FIELDDETECTED_ACTIVATE can be used to avoid this condition.

8.13.3 Pin configuration

NFCT uses two pins to connect the antenna and these pins are shared with GPIOs.

The ENABLE field in register **PADCONFIG** on page 391 defines the usage of these pins and their protection level against excessive voltages. See **Pin assignments** on page 1219 for the pins used by the NFCT peripheral.

When **PADCONFIG.ENABLE=Enabled**, a protection circuit will be enabled on the dedicated pins, preventing the chip from being damaged in the presence of a strong NFC field. The protection circuit will short the two pins together if the voltage difference exceeds approximately 2V. The GPIO function on those pins will also be disabled.

When **PADCONFIG.ENABLE=Disabled**, the device will not be protected against strong NFC field damages caught by a connected NFCT antenna, and the NFCT peripheral will not operate as expected, as it will never leave the DISABLE state.

The pins dedicated to the NFCT antenna function will have some limitation when the pins are configured for normal GPIO operation. The pin capacitance will be higher on those pins (refer to C_{PAD_NFC} in the

Electrical Specification of [GPIO — General purpose input/output](#) on page 292), and some increased leakage current between the two pins is to be expected if they are used in GPIO mode, and are driven to different logical values. To save power, the two pins should always be set to the same logical value whenever entering one of the device power saving modes. For details, refer to I_{NFC_LEAK} in the Electrical Specification of [GPIO — General purpose input/output](#) on page 292.

8.13.4 EasyDMA

The NFCT peripheral implements EasyDMA for reading and writing of data packets from and to the Data RAM.

The NFCT EasyDMA utilizes a pointer called [PACKETPTR](#) on page 386 for receiving and transmitting packets.

The NFCT peripheral uses EasyDMA to read or write RAM, but not both at the same time. The event [RXFRAMESTART](#) indicates that the EasyDMA has started writing to the RAM for a receive frame and the event [RXFRAMEEND](#) indicates that the EasyDMA has completed writing to the RAM. Similarly, the event [TXFRAMESTART](#) indicates that the EasyDMA has started reading from the RAM for a transmit frame and the event [TXFRAMEEND](#) indicates that the EasyDMA has completed reading from the RAM. If a transmit and a receive operation is issued at the same time, the transmit operation would be prioritized.

Starting a transmit operation while the EasyDMA is writing a receive frame to the RAM will result in unpredictable behavior. Starting an EasyDMA operation when there is an ongoing EasyDMA operation may result in unpredictable behavior. It is recommended to wait for the [TXFRAMEEND](#) or [RXFRAMEEND](#) event for the ongoing transmit or receive before starting a new receive or transmit operation.

The [MAXLEN](#) on page 386 register determines the maximum number of bytes that can be read from or written to the RAM. This feature can be used to ensure that the NFCT peripheral does not overwrite, or read beyond, the RAM assigned to a packet. Note that if the [RXD.AMOUNT](#) or [TXD.AMOUNT](#) register indicates longer data packets than set in MAXLEN, the frames sent to or received from the physical layer will be incomplete. If that situation occurs in RX mode, the [OVERRUN](#) bit in the [FRAMESTATUS.RX](#) register will be set and an [RXERROR](#) event will be triggered.

Important: The [RXD.AMOUNT](#) and [TXD.AMOUNT](#) define a frame length in bytes and bits excluding start of frame (SoF), end of frame (EoF), and parity, but including CRC for [RXD.AMOUNT](#) only. Make sure to take potential additional bits into account when setting MAXLEN.

Only sending task [ENABLERXDATA](#) ensures that a new value in [PACKETPTR](#) pointing to the RX buffer in Data RAM is taken into account.

If [PACKETPTR](#) is not pointing to the Data RAM region, an EasyDMA transfer may result in a hard fault or RAM corruption. For more information about the different memory regions, see Chapter [Memory](#) on page 13.

The NFCT peripherals normally do alternative receive and transmit frames. Therefore, to prepare for the next frame, the [PACKETPTR](#), [MAXLEN](#), [TXD.FRAMECONFIG](#) and [TXD.AMOUNT](#) can be updated while the receive is in progress, and, similarly, the [PACKETPTR](#), [MAXLEN](#) and [RXD.FRAMECONFIG](#) can be updated while the transmit is in progress. They can be updated and prepared for the next NFC frame immediately after the [STARTED](#) event of the current frame has been received. Updating the [TXD.FRAMECONFIG](#) and [TXD.AMOUNT](#) during the current transmit frame or updating [RXD.FRAMECONFIG](#) during current receive frame may cause unpredictable behaviour.

In accordance with *NFC Forum, NFC Digital Protocol Technical Specification*, the least significant bit (LSB) from the least significant byte (LSByte) is sent on air first. The bytes are stored in increasing order, starting at the lowest address in the EasyDMA buffer in RAM.

8.13.5 Frame assembler

The NFCT peripheral implements a frame assembler in hardware.

When the NFCT peripheral is in the ACTIVE_A state, the software can decide to enter RX or TX mode. For RX mode, see [Frame disassembler](#) on page 359. For TX mode, the software must indicate the address of the source buffer in Data RAM and its size through programming the [PACKETPTR](#) and MAXLEN registers respectively, then issuing a STARTTX task.

MAXLEN must be set so that it matches the size of the frame to be sent.

The [STARTED](#) event indicates that the PACKETPTR and MAXLEN registers have been captured by the frame assembler EasyDMA.

When asserting the [STARTTX](#) task, the frame assembler module will start reading TXD.AMOUNT.TXDATABYTES bytes (plus one additional byte if TXD.AMOUNT.TXDATABITS > 0) from the RAM position set by the PACKETPTR.

The NFCT peripheral transmits the data as read from RAM, adding framing and the CRC calculated on the fly if set in TXD.FRAMECONFIG. The NFCT peripheral will take $(8 * \text{TXD.AMOUNT.TXDATABYTES} + \text{TXD.AMOUNT.TXDATABITS})$ bits and assemble a frame according to the settings in [TXD.FRAMECONFIG](#). Both short frames, standard frames, and bit-oriented SDD frames as specified in the *NFC Forum, NFC Digital Protocol Technical Specification* can be assembled by the correct setting of the TXD.FRAMECONFIG register.

The bytes will be transmitted on air in the same order as they are read from RAM with a rising bit order within each byte, least significant bit (LSB) first. That is, the least significant bit (b0) will be transmitted on air before the second bit (b1), and so on. The bits read from RAM will be coded into symbols as defined in the *NFC Forum, NFC Digital Protocol Technical Specification*.

Note: Some NFC Forum documents, such as *NFC Forum, NFC Digital Protocol Technical Specification*, define bit numbering in a byte from b1 (LSB) to b8 (most significant bit (MSB)), while most other technical documents from the NFC Forum, and also the Nordic Semiconductor documentation, traditionally number them from b0 to b7. The present document uses the b0–b7 numbering scheme. Be aware of this when comparing the *NFC Forum, NFC Digital Protocol Technical Specification* to others.

The frame assembler can be configured in TXD.FRAMECONFIG to add SoF symbol, calculate and add parity bits, and calculate and add CRC to the data read from RAM when assembling the frame. The total frame will then be longer than what is defined by TXD.AMOUNT.TXDATABYTES. TXDATABITS. DISCARDMODE will select if the first bits in the first byte read from RAM or the last bits in the last byte read from RAM will be discarded if TXD.AMOUNT.TXDATABITS are not equal to zero. Note that if TXD.FRAMECONFIG.PARITY = Parity and TXD.FRAMECONFIG.DISCARDMODE=DiscardStart, a parity bit will be included after the non-complete first byte. No parity will be added after a non-complete last byte.

The frame assemble operation for different settings in TXD.FRAMECONFIG is illustrated in the following table. All shaded bit fields are added by the frame assembler. Some of these bits are optional and appearances are configured in TXD.FRAMECONFIG. Note that the frames illustrated do not necessarily comply with the NFC specification. The figure only illustrates the behavior of the NFCT peripheral.

Data from RAM

Frame on air

PARITY = Parity
TXDATABITS = 0
CRCMODETX = CRC16TX

PARITY = Parity
TXDATABITS = 4
CRCMODETX = NoCRCTX
DISCARDMODE = DiscardStart

PARITY = Parity
TXDATABITS = 0
CRCMODETX = NoCRCTX

Figure 71: Frame assemble illustration

The accurate timing for transmitting the frame on air is set using the frame timing controller settings.

8.13.6 Frame disassembler

The NFCT peripheral implements a frame disassembler in hardware.

When the NFCT peripheral is in the ACTIVE_A state, the software can decide to enter RX or TX mode. For TX mode, see [Frame assembler](#) on page 357. For RX mode, the software must indicate the address and size of the destination buffer in Data RAM through programming the [PACKETPTR](#) and [MAXLEN](#) registers before issuing an [ENABLERXDATA](#) task.

The [STARTED](#) event indicates that the [PACKETPTR](#) and [MAXLEN](#) registers have been captured by the frame disassembler EasyDMA.

When an incoming frame starts, the [RXFRAMESTART](#) event will get issued and data will be written to the buffer in Data RAM. The frame disassembler will verify and remove any parity bits, start of frame (SoF) and end of frame (EoF) symbols on the fly based on [RXD.FRAMECONFIG](#) register configuration. It will, however, verify and transfer the CRC bytes into RAM, if the CRC is enabled through [RXD.FRAMECONFIG](#).

When an EoF symbol is detected, the NFCT peripheral will assert the [RXFRAMEEND](#) event and write the [RXD.AMOUNT](#) register to indicate numbers of received bytes and bits in the data packet. The module does not interpret the content of the data received from the remote NFC device, except for SoF, EoF, parity, and CRC checking, as described above. The frame disassemble operation is illustrated in the following figure.

Frame on air

PARITY = Parity
 RXDATABITS = 0
 CRCMODERX = CRC16RX

PARITY = Parity
 CRCMODERX = NoCRCTR
 RXDATABITS = 4

PARITY = NoParity
 CRCMODERX = NoCRCRX
 RXDATABITS = 0

Data to RAM

Figure 72: Frame disassemble illustration

Per NFC specification, the time between EoF to the next SoF can be as short as 86 μ s, and therefore care must be taken that PACKETPTR and MAXLEN are ready and ENABLERXDATA is issued on time after the end of previous frame. The use of a PPI shortcut from **TXFRAMEEND** to ENABLERXDATA is recommended.

8.13.7 Frame timing controller

The NFCT peripheral includes a frame timing controller that continuously keeps track of the number of the 13.56 MHz RF carrier clock periods since the end of the EoF of the last received frame.

The NFCT peripheral can be programmed to send a responding frame within a time window or at an exact count of RF carrier periods. In case of **FRAMEDELAYMODE** = Window, a **STARTTX** task triggered before the frame timing controller counter is equal to **FRAMEDELAYMIN** will force the transmission to halt until the counter is equal to **FRAMEDELAYMIN**. If the counter is within **FRAMEDELAYMIN** and **FRAMEDELAYMAX** when the **STARTTX** task is triggered, the NFCT peripheral will start the transmission straight away. In case of **FRAMEDELAYMODE** = ExactVal, a **STARTTX** task triggered before the frame delay counter is equal to **FRAMEDELAYMAX** will halt the actual transmission start until the counter is equal to **FRAMEDELAYMAX**.

In case of **FRAMEDELAYMODE** = WindowGrid, the behaviour is similar to the **FRAMEDELAYMODE** = Window, but the actual transmission between **FRAMEDELAYMIN** and **FRAMEDELAYMAX** starts on a bit grid as defined for NFC-A Listen frames (slot duration of 128 RF carrier periods).

An **ERROR** event (with **FRAMEDElayTIMEOUT** cause in **ERRORSTATUS**) will be asserted if the frame timing controller counter reaches **FRAMEDELAYMAX** without any **STARTTX** task triggered. This may happen even when the response is not required as per *NFC Forum, NFC Digital Protocol Technical Specification*. Any commands handled by the automatic collision resolution that don't involve a response being

generated may also result in an ERROR event (with FRAMEDELAYTIMEOUT cause in ERRORSTATUS). The FRAMEDELAYMIN and FRAMEDELAYMAX values shall only be updated before the STARTTX task is triggered. Failing to do so may cause unpredictable behaviour.

The frame timing controller operation is illustrated in the following figure. The frame timing controller automatically adjusts the frame timing counter based on the last received data bit according to NFC-A technology in the *NFC Forum, NFC Digital Protocol Technical Specification*.

Figure 73: Frame timing controller (FRAMEDELAYMODE=Window)

8.13.8 Collision resolution

The NFCT peripheral implements an automatic collision resolution function as defined by the NFC Forum.

Automatic collision resolution is enabled by default, and it is recommended that the feature is used since it is power efficient and reduces the complexity of software handling the collision resolution sequence. This feature can be disabled through the MODE field in the [AUTOCOLRESCONFIG](#) register. When the automatic collision resolution is disabled, all commands will be sent over EasyDMA as defined in frame disassembler.

The [SENSRES](#) and [SELRES](#) registers need to be programmed upfront in order for the collision resolution to behave correctly. Depending on the NFCIDSIZE field in SENSRES, the following registers also need to be programmed upfront:

- NFCID1_LAST if NFCID1SIZE=NFCID1Single (ID = 4 bytes);
- NFCID1_2ND_LAST and NFCID1_LAST if NFCID1SIZE=NFCID1Double (ID = 7 bytes);
- NFCID1_3RD_LAST, NFCID1_2ND_LAST and NFCID1_LAST if NFCID1SIZE=NFCID1Triple (ID = 10 bytes);

A pre-defined set of registers, NFC.TAGHEADER0..3, containing a valid NFCID1 value, is available in FICR and can be used by software to populate the NFCID1_3RD_LAST, NFCID1_2ND_LAST, and NFCID1_LAST registers.

[NFCID1 byte allocation \(top sent first on air\)](#) on page 362 explains the position of the ID bytes in NFCID1_3RD_LAST, NFCID1_2ND_LAST, and NFCID1_LAST, depending on the ID size, and as compared to the definition used in the *NFC Forum, NFC Digital Protocol Technical Specification*.

	ID = 4 bytes	ID = 7 bytes	ID = 10 bytes
NFCID1.Q			nfcid1 ₀
NFCID1.R			nfcid1 ₁
NFCID1.S			nfcid1 ₂
NFCID1.T		nfcid1 ₀	nfcid1 ₃
NFCID1.U		nfcid1 ₁	nfcid1 ₄
NFCID1.V		nfcid1 ₂	nfcid1 ₅
NFCID1.W	nfcid1 ₀	nfcid1 ₃	nfcid1 ₆
NFCID1.X	nfcid1 ₁	nfcid1 ₄	nfcid1 ₇
NFCID1.Y	nfcid1 ₂	nfcid1 ₅	nfcid1 ₈
NFCID1.Z	nfcid1 ₃	nfcid1 ₆	nfcid1 ₉

Table 43: NFCID1 byte allocation (top sent first on air)

The hardware implementation can handle the states from IDLE to ACTIVE_A automatically as defined in the *NFC Forum, NFC Activity Technical Specification*, and the other states are to be handled by software. The software keeps track of the state through events. The collision resolution will trigger an **AUTOCOLRESSTARTED** event when it has started. Reaching the ACTIVE_A state is indicated by the **SELECTED** event.

If collision resolution fails, a **COLLISION** event is triggered. Note that errors occurring during automatic collision resolution may also cause **ERROR** and/or **RXERROR** events to be generated. Other events may also get generated. It is recommended that the software ignores any event except COLLISION, SELECTED and FIELDLOST during automatic collision resolution. Software shall also make sure that any unwanted SHORT or PPI shortcut is disabled during automatic collision resolution.

The automatic collision resolution will be restarted, if the packets are received with CRC or parity errors while in ACTIVE_A state. The automatic collision resolution feature can be disabled while in ACTIVE_A state to avoid this.

The SLP_REQ is automatically handled by the NFCT peripheral when the automatic collision resolution is enabled. However, this results in an ERROR event (with FRAMEDELAYTIMEOUT cause in ERRORSTATUS) since the SLP_REQ has no response. This error must be ignored until the SELECTED event is triggered and this error should be cleared by the software when the SELECTED event is triggered.

8.13.9 Antenna interface

In ACTIVATED state, an amplitude regulator will adjust the voltage swing on the antenna pins to a value that is within the V_{swing} limit.

Refer to [NFCT Electrical Specification](#) on page 1260.

8.13.10 NFCT antenna recommendations

The NFCT antenna coil must be connected differential between NFC1 and NFC2 pins of the device.

Two external capacitors should be used to tune the resonance of the antenna circuit to 13.56 MHz.

Figure 74: NFCT antenna recommendations

The required tuning capacitor value is given by the below equations:

$$C'_{tune} = \frac{1}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} \quad \text{where } C'_{tune} = \frac{1}{2} \cdot (C_p + C_{int} + C_{tune})$$

$$\text{and } C_{tune1} = C_{tune2} = C_{tune} \quad C_{p1} = C_{p2} = C_p \quad C_{int1} = C_{int2} = C_{int}$$

$$C_{tune} = \frac{2}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} - C_p - C_{int}$$

An antenna inductance of $L_{ant} = 2 \mu\text{H}$ will give tuning capacitors in the range of 130 pF on each pin. The total capacitance on **NFC1** and **NFC2** must be matched.

8.13.11 Battery protection

If the antenna is exposed to a strong NFC field, current may flow in the opposite direction on the supply due to parasitic diodes and ESD structures.

If the battery used does not tolerate return current, a series diode must be placed between the battery and the device in order to protect the battery.

8.13.12 Digital Modulation Signal

Support for external analog frontends or antenna architectures is possible by optionally outputting the digital modulation signal to a GPIO.

The NFCT peripheral is designed to connect directly to a loop antenna, receive a modulated signal from an NFC Reader with its internal analog frontend and transmit data back by changing the input resistance that is then seen as modulated load by the NFC Reader.

In addition, the peripheral has an option to output the digital modulation signal to a GPIO. Reception still occurs through the internal analog frontend, whereas transmission can be done by one of the following:

- The internal analog frontend through the loop antenna (default)
- An external frontend using the digital modulation signal
- The combination of both above

There are two registers that allow configuration of the modulation signal (i.e. of the response from NFCT to the NFC Reader), [MODULATIONCTRL](#) and [MODULATIONPSEL](#). The registers need to be programmed before NFCT sends a response to a request from a reader. Ideally, this configuration is performed during startup and whenever the NFCT peripheral is powered up.

The selected GPIO needs to be configured as output in the corresponding GPIO configuration register. It is recommended to set an output value in the corresponding GPIO.OUT register – this value will be driven whenever the NFCT peripheral is disabled.

NFCT drives the pin low when there is no modulation, and drives it with On-Off Keying (OOK) modulation of an 847 kHz subcarrier (derived from the carrier frequency) when it responds to commands from an NFC Reader.

SUBSCRIBE_DISABLE	0x084		Subscribe configuration for task DISABLE
SUBSCRIBE_SENSE	0x088		Subscribe configuration for task SENSE
SUBSCRIBE_STARTTX	0x08C		Subscribe configuration for task STARTTX
SUBSCRIBE_STOPTX	0x090		Subscribe configuration for task STOPTX
SUBSCRIBE_ENABLERXDATA	0x09C		Subscribe configuration for task ENABLERXDATA
SUBSCRIBE_GOIDLE	0x0A4		Subscribe configuration for task GOIDLE
SUBSCRIBE_GOSLEEP	0x0A8		Subscribe configuration for task GOSLEEP
EVENTS_READY	0x100		The NFCT peripheral is ready to receive and send frames
EVENTS_FIELDDETECTED	0x104		Remote NFC field detected
EVENTS_FIELDLIST	0x108		Remote NFC field lost
EVENTS_TXFRAMESTART	0x10C		Marks the start of the first symbol of a transmitted frame
EVENTS_TXFRAMEEND	0x110		Marks the end of the last transmitted on-air symbol of a frame
EVENTS_RXFRAMESTART	0x114		Marks the end of the first symbol of a received frame
EVENTS_RXFRAMEEND	0x118		Received data has been checked (CRC, parity) and transferred to RAM, and EasyDMA has ended accessing the RX buffer
EVENTS_ERROR	0x11C		NFC error reported. The ERRORSTATUS register contains details on the source of the error.
EVENTS_RXERROR	0x128		NFC RX frame error reported. The FRAMESTATUS.RX register contains details on the source of the error.
EVENTS_ENDRX	0x12C		RX buffer (as defined by PACKETPTR and MAXLEN) in Data RAM full.
EVENTS_ENDTX	0x130		Transmission of data in RAM has ended, and EasyDMA has ended accessing the TX buffer
EVENTS_AUTOCOLRESSTARTED	0x138		Auto collision resolution process has started
EVENTS_COLLISION	0x148		NFC auto collision resolution error reported.
EVENTS_SELECTED	0x14C		NFC auto collision resolution successfully completed
EVENTS_STARTED	0x150		EasyDMA is ready to receive or send frames.
PUBLISH_READY	0x180		Publish configuration for event READY
PUBLISH_FIELDDETECTED	0x184		Publish configuration for event FIELDDETECTED
PUBLISH_FIELDLIST	0x188		Publish configuration for event FIELDLIST

PUBLISH_SELECTED	0x1CC		Publish configuration for event SELECTED
PUBLISH_STARTED	0x1D0		Publish configuration for event STARTED
SHORTS	0x200		Shortcuts between local events and tasks
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
ERRORSTATUS	0x404		NFC Error Status register
FRAMESTATUS.RX	0x40C		Result of last incoming frame
NFCTAGSTATE	0x410		Current operating state of NFC tag
SLEEPSTATE	0x420		Sleep state during automatic collision resolution
FIELDPRESENT	0x43C		Indicates the presence or not of a valid field
FRAMEDELAYMIN	0x504		Minimum frame delay
FRAMEDELAYMAX	0x508		Maximum frame delay
FRAMEDELAYMODE	0x50C		Configuration register for the Frame Delay Timer
PACKETPTR	0x510		Packet pointer for TXD and RXD data storage in Data RAM

Register	Offset	TZ	Description
MAXLEN	0x514		Size of the RAM buffer allocated to TXD and RXD data storage each
TXD.FRAMECONFIG	0x518		Configuration of outgoing frames
TXD.AMOUNT	0x51C		Size of outgoing frame
RXD.FRAMECONFIG	0x520		Configuration of incoming frames
RXD.AMOUNT	0x524		Size of last incoming frame
MODULATIONCTRL	0x52C		Enables the modulation output to a GPIO pin which can be connected to a second external antenna.
MODULATIONPSEL	0x538		Pin select for Modulation control
MODE	0x550		Configure EasyDMA mode
NFCID1.LAST	0x590		Last NFCID1 part (4, 7 or 10 bytes ID)
NFCID1.SECONDLAST	0x594		Second last NFCID1 part (7 or 10 bytes ID)
NFCID1.THIRDLAST	0x598		Third last NFCID1 part (10 bytes ID)
AUTOCOLRESCONFIG	0x59C		Controls the auto collision resolution function. This setting must be done before the NFCT peripheral is activated.
SENSRES	0x5A0		NFC-A SENS_RES auto-response settings
SELRES	0x5A4		NFC-A SEL_RES auto-response settings
PADCONFIG	0x6D4		NFC pad configuration

8.14 PDM — Pulse density modulation interface

The pulse density modulation (PDM) peripheral enables input of pulse density modulated signals from external audio interfaces, such as digital microphones. PDM generates the PDM clock and supports single-channel or dual-channel (left and right) data input. Data is transferred directly to RAM buffers using EasyDMA.

The main features of PDM are the following:

- Up to two PDM microphones configured as a left/right pair using the same data input
- 8 kHz, 16 kHz, 32 kHz, or 48k Hz output sample rate, 16-bit samples
- Supports digital microphone clocks at 768 kHz, 800 kHz, 1.024 MHz , 1.536 MHz, 2.048 MHz , 3.072 MHz , 1.28 MHz, and 2.56 MHz
- Selectable sample rate ratio of 48, 50, 64, 80, 96, 150,192, or custom even values up to 256 between PDM_CLK and output sample rate
- Hardware decimation filters
- EasyDMA support for sample buffering

The following figure shows the interaction between the PDM interface and up to two digital microphones. EasyDMA reduces the real-time requirements for controlling the PDM target from a low priority CPU execution context. PDM has the necessary digital filter elements to produce pulse code modulation (PCM) samples and allows continuous audio streaming.

Figure 75: PDM module

8.14.1 Master clock generator

The PDM clock frequency is adjusted through the PRESCALER register in the master clock. The master clock generator does not add jitter to the selected HFCLK source. It is recommended (but not mandatory) to use the crystal as HFCLK source.

The PDM frequency can be adjusted by using the PRESCALER register, even while the clock generator is running. To select the correct value for PRESCALER, use the following equation:

- $CLK = PCLK32M / PRESCALER$ when using PCLK32M
- $CLK = ACLK / PRESCALER$ when using a second CLK source

Note: Depending on the product, ACLK can be connected to different clock sources. For example, ACLK can be connected to a PLL generating a 24 MHz clock.

Requested PDM frequency f_{pdm} [Hz]	f_{source} [Hz]	RATIO	PRESCALER	Actual PDM frequency f_{actual} [Hz]	Sample frequency [Hz]	Error [%]
1024000	32000000 (PCLK32M)	64	31	1032258	16129	0.8
1280000	32000000 (PCLK32M)	80	25	1280000	16000	0
800000	32000000 (PCLK32M)	50	40	800000	16000	0.0
1024000	24000000 (ACLK)	64	23	1043478	16304	1.9
1280000	24000000 (ACLK)	80	19	1263157	15789	-1.31
800000	24000000 (ACLK)	50	30	800000	16000	0.0

Table 44: Configuration examples

8.14.2 Module operation

By default, bits from the left PDM microphone are sampled on PDM_CLK falling edge, and bits for the right are sampled on the rising edge of PDM_CLK, resulting in two bitstreams. Each bitstream is fed into a digital

filter which converts the PDM stream into 16-bit PCM samples, then filters and down-samples them to reach the appropriate sample rate.

The EDGE field in the MODE register allows swapping left and right channels, so that left will be sampled on rising edge, and right on falling.

The PDM module uses EasyDMA to store the samples coming out from the filters into one buffer in RAM. Depending on the mode chosen in the OPERATION field in the MODE register, memory either contains alternating left and right 16-bit samples (Stereo), or only a left (or only right, depending on the value of the EDGE field) 16-bit samples (Mono). To ensure continuous PDM sampling, it is up to the application to update the EasyDMA destination address pointer as the previous buffer is filled.

The continuous transfer can be started or stopped by sending the START and STOP tasks. STOP becomes effective after the current frame has finished transferring, which will generate the STOPPED event. The STOPPED event indicates that all activity in the module is finished, and that the data is available in RAM (EasyDMA has finished transferring as well). Attempting to restart before receiving the STOPPED event may result in unpredictable behavior.

Soft Gain/Mute

A short description of the Gain, Mute, and Soft Gain/Mute functionality is provided below.

Gain

The gain is configurable in the range [-20, 20] dB, using the following registers:

- [GAINL](#) – left channel, in 0.5 dB steps
- [GAINR](#) – right channel, in 0.5 dB steps
- [FILTER.CTRL.GAINADDOP25](#) – additional gain, one optional +0.25 dB step that applies to both channels

Custom oversampling rates and CIC filter gain compensation

PDM supports gain compensation, for the selected decimation/oversampling ratio (OSR).

The decimation ratio is set in [RATIO](#), as either one of the listed ratios, or the special value `Custom`. When `RATIO=Custom`, the actual decimation rate is configured using the register [FILTER.CTRL.DECRATIO](#). When using custom decimation ratios, configure register [FILTER.CTRL.CICFILTERMSBCUSTOM](#) to match [FILTER.CTRL.DECRATIO](#).

PDM uses partial gain compensation towards the closest upper power of 2. For the fixed OSR ratios, compensation gain is fixed and pre-calculated in the design. However, when using custom oversampling ratios, the gain compensation must be calculated and configured.

To calculate the additional compensated gain for Custom OSR ratios, please follow the steps below:

1. Calculate the CIC filter gain:

$$\text{gainCIC} = \text{OSR}^5$$

where OSR is the oversampling ratio and the CIC filter order is 5.

2. Determine the closest upper power of 2:

$$\text{closePow2} = \text{floor}(\log_2(\text{gainCIC})) + 1$$

3. Calculate the required gain compensation:

$$\text{gainComp} = -20 \times \log_{10}(\text{gainCIC} / 2^{\text{closePow2}}) \text{ dB}$$

4. Configure the compensation registers:

- [FILTER.CTRL.MINORSTEP050CUSTOM](#) – Set the number of +0.5 dB steps
- [FILTER.CTRL.MINORSTEP025CUSTOM](#) – To add an additional +0.25 dB step

Note: These registers are only active when `RATIO = Custom` (Custom decimation ratio mode).

Mute

The Mute function is a specific case of the Gain function, where the gain coefficient is set to 0.

This function is controlled using the `FILTER.SOFTMUTE` register.

Soft Gain/Mute

The Soft Gain/Mute provides the possibility to gradually change the gain setting, to avoid a sudden gain change which may lead to audible clicks.

The Soft Gain/Mute function is controlled using the registers `FILTER.SOFTCYCLES` (the number of soft cycles at the baseband frequency). If `FILTER.SOFTCYCLES` is set to `Custom`, then the actual number of softcycles used is configured using the register `FILTER.CTRL.SOFTCYCLES` (using a multiplication factor of 32).

Gain Range

The desired gain range is $[-20, 20]$ dB with 0.5 dB steps, with the option to improve gain resolution to 0.25 dB steps.

8.14.3 Decimation filter

In order to convert the incoming data stream into PCM audio samples, a decimation filter is included in the PDM peripheral.

The filter input is a two-channel PDM serial stream (with left channel on clock high, right channel on clock low). Output consists of two 16-bit PCM samples at a sample rate lower than the PDM clock rate and a ratio defined by the `RATIO` register.

A digital volume control is implemented within the filter stage of each channel. It can attenuate or amplify the output samples in a range of ± 20 dB of the default (reset) setting and is defined by $G_{PDM, default} = 0$ dB. The gain is controlled by the `GAINL` and `GAINR` registers. As shown in [#unique_1019/unique_1019_Connect_42_section_vqt_d1g_xcc](#), depending on OSR value, internal compensation is added for fixed predefined OSR values and a programmable one is available for custom OSR values.

8.14.4 EasyDMA

Samples are written directly to RAM, meaning EasyDMA must be configured appropriately.

The address pointer for the EasyDMA channel is set in the `SAMPLE.PTR` register. If the destination address set in `SAMPLE.PTR` is not pointing to the Data RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 13 for more information about memory regions.

Note: The value programmed in `SAMPLE.PTR` register must be 32-bit aligned.

DMA transfer supports Stereo (left and right 16-bit samples) and Mono (left only) data transfer as configured in the `OPERATION` field of the `MODE` register. The samples are stored as little endian.

MODE.OPERATION	Bits per sample	Result stored per RAM word	Physical RAM allocated (32-bit words)	Result boundary indexes in RAM	Note
Stereo	32 (2x16)	L+R	$\text{ceil}(\text{SAMPLE.MAXCNT}/2)$	R0=[31:16] L0=[15:0]	Default
Mono	16	2xL	$\text{ceil}(\text{SAMPLE.MAXCNT})$	L1=[31:16] L0=[15:0]	

Table 45: DMA sample storage

The destination buffer in RAM consists of one block, where the size of the block is set in the SAMPLE.MAXCNT register. The sample format is number of bytes used by the samples that will be stored in the memory. The physical RAM allocated is always the following:

```
(RAM allocation, in bytes)=SAMPLE.MAXCNT * 2;
```

Sample mapping depends on MODE.OPERATION.

If OPERATION=Stereo, RAM will contain a succession of left and right samples.

If OPERATION=Mono, RAM will contain a succession of left only samples.

For a given value of SAMPLE.MAXCNT, the buffer in RAM can contain half the stereo sampling time as compared to the mono sampling time.

The PDM acquisition can be started by the START task, after the SAMPLE.PTR and SAMPLE.MAXCNT registers have been written. When PDM starts, it will take some time ($t_{\text{PDM,DATA}}$) for the filters to generate valid data. Transients from the PDM microphone itself may also occur. The first few samples (typically around 50) can contain invalid values or transients. It is advised to discard the first few samples after a PDM start.

As soon as the STARTED event is received, the firmware can write the next SAMPLE.PTR value (this register is double-buffered), to ensure continuous operation.

When the buffer in RAM is full of samples, an END event is triggered. The firmware can start processing the data in the buffer. At the same time, PDM starts acquiring data into the new buffer pointed to by SAMPLE.PTR. It sends a new STARTED event, so that the firmware can update SAMPLE.PTR to the next buffer address.

8.14.5 Hardware example

PDM can be configured with a single microphone (mono), or with two microphones.

When a single microphone is used, connect the microphone clock to CLK, and data to DIN. The following figures show a single PDM microphone wired as left.

Figure 76: Left wired microphone

The following figures show a single PDM microphone wired as right.

Figure 77: Right wired microphone

A single microphone (mono) configuration, depending on the microphone's implementation, either the left or the right channel (sampled at falling or rising CLK edge respectively) will contain reliable data.

If two microphones are used, one of them has to be set as left, the other as right (L/R pin tied high or to GND on the respective microphone). It is strongly recommended to use two identical microphones so their timing in left and right operations match.

Figure 78: Example of two PDM microphones

8.14.6 Pin configuration

The CLK and DIN signals assigned to the PDM peripheral are mapped to physical pins according to the configuration specified in the PSEL.CLK and PSEL.DIN registers respectively. If the CONNECT field in any PSEL register is set to *Disconnected*, the associated PDM signal will not be connected to the required physical pins and will not operate properly.

The PSEL.CLK and PSEL.DIN registers and their configurations are only used when PDM is enabled, and retained while the device is in System ON mode. See [POWER — Power control](#) on page 100 for more information about power modes. When the peripheral is disabled, the pins behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN_CNF[n] register.

To ensure correct behavior in the PDM module, the pins used by the PDM module must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 398 before enabling the PDM module. This is to ensure that the pins used by the PDM module are driven correctly if the PDM module itself is temporarily disabled or the device temporarily enters System OFF. This configuration must be retained in the GPIO for the selected I/Os as long as the PDM module is supposed to be connected to an external PDM circuit.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

PDM signal	PDM pin	Direction	Output value	Comment
CLK	As specified in PSEL.CLK	Output	0	
DIN	As specified in PSEL.DIN	Input	Not applicable

PDM21 : S	GLOBAL	0x500D1000	US	S	SA	No	Pulse density modulation (digital microphone) interface PDM21
PDM21 : NS		0x400D1000					

Configuration

Instance	Domain	Configuration
PDM20 : S PDM20 : NS	GLOBAL	Use GPIO port P1 or P3
		ACLK is the fixed 24 MHz clock PCLK24M
		PCLK is the fixed 32 MHz clock PCLK32M
		Supports 8, 16, 32, 48 kHz sample rate.
PDM21 : S PDM21 : NS	GLOBAL	CURRENTAMOUNT register included.
		Use GPIO port P1 or P3
		ACLK is the fixed 24 MHz clock PCLK24M
		PCLK is the fixed 32 MHz clock PCLK32M
		Supports 8, 16, 32, 48 kHz sample rate.
		CURRENTAMOUNT register included.

Register overview

Register	Offset	TZ	Description
TASKS_START	0x000		Starts continuous PDM transfer
TASKS_STOP	0x004		Stops PDM transfer
SUBSCRIBE_START	0x080		Subscribe configuration for task START
SUBSCRIBE_STOP	0x084		Subscribe configuration for task STOP
EVENTS_STARTED	0x100		PDM transfer has started
EVENTS_STOPPED	0x104		PDM transfer has finished
EVENTS_END	0x108		The PDM has written the last sample specified by SAMPLE.MAXCNT (or the last sample after a STOP task has been received) to Data RAM
EVENTS_DMA.BUSERROR	0x110		This event is generated if an error occurs during the bus transfer.
PUBLISH_STARTED	0x180		Publish configuration for event STARTED
PUBLISH_STOPPED	0x184		Publish configuration for event STOPPED

Register	Offset	TZ	Description
PUBLISH_END	0x188		Publish configuration for event END
PUBLISH_DMA.BUSERERROR	0x190		Publish configuration for event DMA.BUSERERROR
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
ENABLE	0x500		PDM module enable register
MODE	0x508		Defines the routing of the connected PDM microphone signals
GAINL	0x518		Left output gain adjustment
GAINR	0x51C		Right output gain adjustment
RATIO	0x520		Selects the decimation ratio between PDM_CLK and output sample rate. When RATIO is selected to be "custom", the decimation rate should be set using the FILTER.CTRL field before setting the RATIO to 7 Change PRESCALER.DIVISOR accordingly.
FILTER.CTRL	0x524		Additional PDM configurability
FILTER.HPPOLE	0x528		Settings for the high-pass filter
FILTER.HPDISABLE	0x52C		High pass filter disable
FILTER.SOFTMUTE	0x530		Soft mute function
FILTER.SOFTCYCLES	0x534		Soft mute settings
FILTER.SAMPLEDELAY	0x538		Input Data Sampling with Number of ckFilterL (double frequency of PDM_CLK) Clock Cycle Delay. Optionally, input sample point can be delayed independently on left and right channels using FILTER.CTRL[20:19] bits
PSEL.CLK	0x540		Pin number configuration for PDM CLK signal
PSEL.DIN	0x544		Pin number configuration for PDM DIN signal
CLKSELECT	0x54C		Master clock generator configuration
SAMPLE.PTR	0x560		RAM address pointer to write samples to with EasyDMA
SAMPLE.MAXCNT	0x564		Number of bytes to allocate memory for in EasyDMA mode
PRESCALER	0x580		The prescaler is used to set the PDM frequency
DMA.TERMINATEONBUSERERROR	0x700		Terminate the transaction if a BUSERERROR event is detected.
DMA.BUSERERRORADDRESS	0x704		Address of transaction that generated the last BUSERERROR event.

8.14.7.1 TASKS_START

Address offset: 0x000

Starts continuous PDM transfer

8.15 PWM — Pulse width modulation

The pulse width modulation peripheral (PWM) enables the generation of pulse width modulated signals on GPIO. The peripheral implements a counter with up-count mode and up-and-down-count mode, consisting of four PWM channels that can drive assigned GPIO pins.

The main features of PWM are the following:

- Programmable PWM frequency
- Up to four PWM channels with individual polarity and duty cycle values
- Edge or center-aligned pulses across PWM channels
- Multiple duty cycle arrays (sequences) defined in RAM
- Autonomous and glitch-free update of duty cycle values directly from memory through EasyDMA (no CPU involvement)
- Change of polarity, duty cycle, and base frequency on every PWM period
- RAM sequences can be repeated or connected into loops

Figure 79: PWM module

8.15.1 Wave counter

The wave counter is responsible for generating the pulses at a duty cycle that depends on the compare values, and at a frequency that depends on COUNTERTOP.

There is one common 15-bit counter with four compare channels. Thus, all four channels will share the same period (PWM frequency), but can have individual duty cycle and polarity. The polarity is set by the most significant bit (MSB) of the value read from RAM (see figure [Decoder memory access modes](#) on page 416). When the MSB bit is high (FallingEdge polarity), OUT[n] starts high to become low during the given PWM cycle, whereas the inverse occurs for RisingEdge polarity. Whether the counter counts up, or up and down, is controlled by the MODE register.

The timer top value is controlled by the COUNTERTOP register. This register value, in conjunction with the selected PRESCALER of the PWM_CLK, will result in a given PWM period. A COUNTERTOP value smaller than the compare setting will result in a state where no PWM edges are generated. OUT[n] is held high, given that the polarity is set to FallingEdge. All compare registers are internal and can only be configured through decoder presented later. COUNTERTOP can be safely written at any time.

Sampling follows the START task. If DECODER.LOAD=WaveForm, the register value is ignored and taken from RAM instead (see section [Decoder with EasyDMA](#) on page 416 for more details). If DECODER.LOAD is anything else than the WaveForm, it is sampled following a STARTSEQ[n] task and when loading a new value from RAM during a sequence playback.

The following figure shows the counter operating in up mode (MODE=PWM_MODE_Up), with two PWM channels with the same frequency but different duty cycle:

Figure 80: PWM counter in up mode example - RisingEdge polarity

The counter is automatically reset to zero when COUNTERTOP is reached and OUT[n] will invert. OUT[n] is held low if the compare value is 0 and held high if set to COUNTERTOP, given that the polarity is set to FallingEdge. Counter running in up mode results in pulse widths that are edge-aligned. The following is the code for the counter in up mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_port << PWM_PSEL_OUT_PORT_Pos) |
    (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_port << PWM_PSEL_OUT_PORT_Pos) |
    (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->DMA.SEQ[0].PTR = ((uint32_t) (pwm_seq) << PWM_DMA_SEQ_PTR_PTR_Pos);
NRF_PWM0->DMA.SEQ[0].MAXCNT = (sizeof(pwm_seq) << PWM_DMA_SEQ_MAXCNT_MAXCNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_DMA.SEQ[0].START = 1;
```

When the counter is running in up mode, the following formula can be used to compute the PWM period and the step size:

$$\text{PWM period: } T_{\text{PWM(Up)}} = T_{\text{PWM_CLK}} * \text{COUNTERTOP}$$

Step width/Resolution: $T_{\text{steps}} = T_{\text{PWM_CLK}}$

The following figure shows the counter operating in up-and-down mode (MODE=PWM_MODE_UpAndDown), with two PWM channels with the same frequency but different duty cycle and output polarity:

Figure 81: PWM counter in up-and-down mode example

The counter starts decrementing to zero when COUNTERTOP is reached and will invert the OUT[n] when compare value is hit for the second time. This results in a set of pulses that are center-aligned. The following is the code for the counter in up-and-down mode example:

```
uint16_t pwm_seq[4] = {PWM_CH0_DUTY, PWM_CH1_DUTY, PWM_CH2_DUTY, PWM_CH3_DUTY};
NRF_PWM0->PSEL.OUT[0] = (first_port << PWM_PSEL_OUT_PORT_Pos) |
    (first_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->PSEL.OUT[1] = (second_pin << PWM_PSEL_OUT_PIN_Pos) |
    (PWM_PSEL_OUT_CONNECT_Connected <<
        PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE = (PWM_MODE_UPDOWN_UpAndDown << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER = (PWM_PRESCALER_PRESCALER_DIV_1 <<
    PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER = (PWM_DECODER_LOAD_Individual << PWM_DECODER_LOAD_Pos) |
    (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->DMA.SEQ[0].PTR = ((uint32_t) (pwm_seq) << PWM_DMA_SEQ_PTR_PTR_Pos);
NRF_PWM0->DMA.SEQ[0].MAXCNT = (sizeof(pwm_seq) << PWM_DMA_SEQ_MAXCNT_MAXCNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_DMA.SEQ[0].START = 1;
```

When the counter is running in up-and-down mode, the following formula can be used to compute the PWM period and the step size:

$$T_{\text{PWM(Up And Down)}} = T_{\text{PWM_CLK}} * 2 * \text{COUNTERTOP}$$

$$\text{Step width/Resolution: } T_{\text{steps}} = T_{\text{PWM_CLK}} * 2$$

8.15.2 Decoder with EasyDMA

The decoder uses EasyDMA to take PWM parameters stored in RAM and update the internal compare registers of the wave counter, based on the mode of operation.

PWM parameters are organized into a sequence containing at least one half word (16 bit). Its most significant bit[15] denotes the polarity of the OUT[n] while bit[14:0] is the 15-bit compare value.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
Id				B A																															

The DECODER register controls how the RAM content is interpreted and loaded into the internal compare registers. The LOAD field controls if the RAM values are loaded to all compare channels, or to update a group or all channels with individual values. The following figure illustrates how parameters stored in RAM are organized and routed to various compare channels in different modes:

Figure 82: Decoder memory access modes

A special mode of operation is available when `DECODER.LOAD` is set to `WaveForm`. In `WaveForm` mode, up to three PWM channels can be enabled - `OUT[0]` to `OUT[2]`. In RAM, four values are loaded at a time: the first, second and third location are used to load the values, and the fourth RAM location is used to load the `COUNTERTOP` register. This way one can have up to three PWM channels with a frequency base that changes on a per PWM period basis. This mode of operation is useful for arbitrary wave form generation in applications, such as LED lighting.

The register `SEQ[n].REFRESH=N` (one per sequence $n=0$ or 1) will instruct a new RAM stored pulse width value on every $(N+1)^{\text{th}}$ PWM period. Setting the register to zero will result in a new duty cycle update every PWM period, as long as the minimum PWM period is observed.

Note that registers `SEQ[n].REFRESH` and `SEQ[n].ENDDELAY` are ignored when `DECODER.MODE=NextStep`. The next value is loaded upon every received `NEXTSTEP` task.

`SEQ[n].PTR` is the pointer used to fetch `COMPARE` values from RAM. If the `SEQ[n].PTR` is not pointing to a RAM region, an EasyDMA transfer may result in a `HardFault` or RAM corruption. See [Memory](#) on page 13 for more information about the different memory regions. After the `SEQ[n].PTR` is set to the desired RAM location, the `SEQ[n].MAXCNT` register must be set to the number of bytes in the sequence. It is important to observe that the Grouped mode requires one half word per group, while the Single mode requires one half word per channel, thus increasing the RAM size occupation. If PWM generation is not running when the `DMA.SEQ[n].START` task is triggered, the task will load the first value from RAM and then start the PWM generation. A `SEQSTARTED[n]` event is generated as soon as the EasyDMA has read the first PWM parameter from RAM and the wave counter has started executing it. When `LOOP.MAXCNT=0`, sequence $n=0$ or 1 is played back once. After the last value in the sequence has been loaded and started executing, a `SEQEND[n]` event is generated. The PWM generation will then continue with the output defined in the `IDLEOUT` register. The following figure illustrates an example of a simple playback.

Figure 83: Simple sequence example

The following source code is used for configuration and timing details in a sequence where only sequence 0 is used and only run once with a new PWM duty cycle for each period.

```

NRF_PWM0->PSEL.OUT[0] = (first_port << PWM_PSEL_OUT_PORT_Pos) |
                        (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                         PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (PWM_LOOP_CNT_Disabled << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->DMA.SEQ[0].PTR = ((uint32_t)(seq0_ram) << PWM_DMA_SEQ_PTR_PTR_Pos);
NRF_PWM0->DMA.SEQ[0].MAXCNT = (sizeof(seq0_ram) << PWM_DMA_SEQ_MAXCNT_MAXCNT_Pos);
NRF_PWM0->SEQ[0].REFRESH = 0;
NRF_PWM0->SEQ[0].ENDDELAY = 0;
NRF_PWM0->TASKS_DMA.SEQ[0].START = 1;

```

To completely stop the PWM generation and force the associated pins to a defined state, a STOP task can be triggered at any time. A STOPPED event is generated when the PWM generation has stopped at the end of the currently running PWM period, and the pins go into their idle state as defined by the IDLEOUT register. PWM generation can then only be restarted through a DMA.SEQ[n].START task. DMA.SEQ[n].START will resume PWM generation after having loaded the first value from the RAM buffer defined in the SEQ[n].PTR register.

The following table indicates when specific registers get sampled by the hardware. Care should be taken when updating these registers to avoid that values are applied earlier than expected.

Register	Taken into account by hardware	Recommended (safe) update
SEQ[n].PTR	When sending the DMA.SEQ[n].START task	After having received the SEQSTARTED[n] event
SEQ[n].MAXCNT	When sending the DMA.SEQ[n].START task	After having received the SEQSTARTED[n] event
SEQ[0].ENDDELAY	When sending the SEQSTART[0] task Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event)	Before starting sequence [0] through a SEQSTART[0] task When no more value from sequence [0] gets loaded from RAM (indicated by the SEQEND[0] event) At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated)
SEQ[1].ENDDELAY	When sending the SEQSTART[1] task Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event)	Before starting sequence [1] through a SEQSTART[1] task When no more value from sequence [1] gets loaded from RAM (indicated by the SEQEND[1] event) At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated)
SEQ[0].REFRESH	When sending the SEQSTART[0] task Every time a new value from sequence [0] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event)	Before starting sequence [0] through a SEQSTART[0] task At any time during sequence [1] (which starts when the SEQSTARTED[1] event is generated)
SEQ[1].REFRESH	When sending the SEQSTART[1] task Every time a new value from sequence [1] has been loaded from RAM and gets applied to the Wave Counter (indicated by the PWMPERIODEND event)	Before starting sequence [1] through a SEQSTART[1] task At any time during sequence [0] (which starts when the SEQSTARTED[0] event is generated)
COUNTERTOP	In DECODER.LOAD=WaveForm: this register is ignored. In all other LOAD modes: at the end of current PWM period (indicated by the PWMPERIODEND event)	Before starting PWM generation through a DMA.SEQ[n].START task After a STOP task has been triggered, and the STOPPED event has been received.
MODE	Immediately	Before starting PWM generation through a DMA.SEQ[n].START task After a STOP task has been triggered, and the STOPPED event has been received.
DECODER	Immediately	Before starting PWM generation through a DMA.SEQ[n].START task After a STOP task has been triggered, and the STOPPED event has been received.
PRESCALER	Immediately	Before starting PWM generation through a DMA.SEQ[n].START task After a STOP task has been triggered, and the STOPPED event has been received.
LOOP	Immediately	Before starting PWM generation through a DMA.SEQ[n].START task After a STOP task has been triggered, and the STOPPED event has been received.
PSEL.OUT[n]	Immediately	Before enabling the PWM instance through the ENABLE register

Table 47: When to safely update PWM registers

Note: SEQ[n].REFRESH and SEQ[n].ENDDELAY are ignored at the end of a complex sequence, indicated by a LOOPSDONE event. The reason for this is that the last value loaded from RAM is maintained until further action from software (restarting a new sequence, or stopping PWM generation).

The following figure shows a more complex example using the register [LOOP](#) on page 441.

Figure 84: Example using two sequences

In this case, an automated playback takes place, consisting of SEQ[0], delay 0, SEQ[1], delay 1, then again SEQ[0], etc. The user can choose to start a complex playback with SEQ[0] or SEQ[1] through sending the SEQSTART[0] or SEQSTART[1] task. The complex playback always ends with delay 1.

The two sequences 0 and 1 are defined by the addresses of value tables in RAM (pointed to by SEQ[n].PTR) and the buffer size (SEQ[n].MAXCNT). The rate at which a new value is loaded is defined individually for each sequence by SEQ[n].REFRESH. The chaining of sequence 1 following the sequence 0 is implicit, the LOOP.CNT register allows the chaining of sequence 1 to sequence 0 for a determined number of times. In other words, it allows to repeat a complex sequence a number of times in a fully automated way.

In the following code example, sequence 0 is defined with SEQ[0].REFRESH set to 1, meaning that a new PWM duty cycle is pushed every second PWM period. This complex sequence is started with the SEQSTART[0] task, so SEQ[0] is played first. Since SEQ[0].ENDDDELAY=1 there will be one PWM period delay between last period on sequence 0 and the first period on sequence 1. Since SEQ[1].ENDDDELAY=0 there is no delay 1, so SEQ[0] would be started immediately after the end of SEQ[1]. However, as LOOP.CNT is

1, the playback stops after having played SEQ[1] only once, and both SEQEND[1] and LOOPSDONE are generated (their order is not guaranteed in this case).

```

NRF_PWM0->PSEL.OUT[0] = (first_port << PWM_PSEL_OUT_PORT_Pos) |
                        (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                        (PWM_PSEL_OUT_CONNECT_Connected <<
                         PWM_PSEL_OUT_CONNECT_Pos);
NRF_PWM0->ENABLE      = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE        = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER   = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                         PWM_PRESCALER_PRESCALER_Pos);
NRF_PWM0->COUNTERTOP  = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
NRF_PWM0->LOOP        = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER     = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                        (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);
NRF_PWM0->DMA.SEQ[0].PTR   = ((uint32_t)(seq0_ram) << PWM_DMA_SEQ_PTR_PTR_Pos);
NRF_PWM0->DMA.SEQ[0].MAXCNT = (sizeof(seq0_ram) << PWM_DMA_SEQ_MAXCNT_MAXCNT_Pos);
NRF_PWM0->SEQ[0].REFRESH  = 1;
NRF_PWM0->SEQ[0].ENDDELAY = 1;
NRF_PWM0->DMA.SEQ[1].PTR   = ((uint32_t)(seq1_ram) << PWM_DMA_SEQ_PTR_PTR_Pos);
NRF_PWM0->DMA.SEQ[1].MAXCNT = (sizeof(seq1_ram) << PWM_DMA_SEQ_MAXCNT_MAXCNT_Pos);
NRF_PWM0->SEQ[1].REFRESH  = 0;
NRF_PWM0->SEQ[1].ENDDELAY = 0;
NRF_PWM0->TASKS_DMA.SEQ[0].START = 1;

```

The decoder can also be configured to asynchronously load new PWM duty cycle. If the DECODER.MODE register is set to NextStep, then the NEXTSTEP task will cause an update of internal compare registers on the next PWM period.

The following figures provide an overview of each part of an arbitrary sequence, in various modes (LOOP.CNT=0 and LOOP.CNT>0). In particular, the following are represented:

- Initial and final duty cycle on the PWM output(s)
- Chaining of SEQ[0] and SEQ[1] if LOOP.CNT>0
- Influence of registers on the sequence
- Events generated during a sequence
- DMA activity (loading of next value and applying it to the output(s))

Figure 85: Single shot ($LOOP.CNT=0$)

Note: The single-shot example also applies to $SEQ[1]$. Only $SEQ[0]$ is represented for simplicity.

Figure 86: Complex sequence ($LOOP.CNT > 0$) starting with $SEQ[0]$

Figure 87: Complex sequence ($LOOP.CNT > 0$) starting with $SEQ[1]$

Note: If a sequence is in use in a simple or complex sequence, it must have a length of $SEQ[n].MAXCNT > 0$.

This example shows how the PWM module can be configured to repeat a single sequence until stopped.

```
NRF_PWM0->PSEL.OUT[0] = (first_port << PWM_PSEL_OUT_PORT_Pos) |
                          (first_pin << PWM_PSEL_OUT_PIN_Pos) |
                          (PWM_PSEL_OUT_CONNECT_Connected <<
                           PWM_PSEL_OUT_CONNECT_Pos);

NRF_PWM0->ENABLE        = (PWM_ENABLE_ENABLE_Enabled << PWM_ENABLE_ENABLE_Pos);
NRF_PWM0->MODE          = (PWM_MODE_UPDOWN_Up << PWM_MODE_UPDOWN_Pos);
NRF_PWM0->PRESCALER     = (PWM_PRESCALER_PRESCALER_DIV_1 <<
                           PWM_PRESCALER_PRESCALER_Pos);

NRF_PWM0->COUNTERTOP    = (16000 << PWM_COUNTERTOP_COUNTERTOP_Pos); //1 msec
// Enable the shortcut from LOOPSDONE event to DMA.SEQ1.START task for infinite loop
NRF_PWM0->SHORTS        = (PWM_SHORTS_LOOPSDONE_DMA_SEQ1_START_Enabled <<
                           PWM_SHORTS_LOOPSDONE_DMA_SEQ1_START_Pos);

// LOOP_CNT must be greater than 0 for the LOOPSDONE event to trigger and enable looping
NRF_PWM0->LOOP          = (1 << PWM_LOOP_CNT_Pos);
NRF_PWM0->DECODER       = (PWM_DECODER_LOAD_Common << PWM_DECODER_LOAD_Pos) |
                          (PWM_DECODER_MODE_RefreshCount << PWM_DECODER_MODE_Pos);

// To repeat a single sequence until stopped, it must be configured in SEQ[1]
NRF_PWM0->DMA.SEQ[1].PTR = ((uint32_t)(seq0_ram)) << PWM_DMA_SEQ_PTR_PTR_Pos;
NRF_PWM0->DMA.SEQ[1].MAXCNT = (sizeof(seq0_ram) << PWM_DMA_SEQ_MAXCNT_MAXCNT_Pos);
NRF_PWM0->SEQ[1].REFRESH = 0;
NRF_PWM0->SEQ[1].ENDDelay = 0;
NRF_PWM0->TASKS_DMA.SEQ[1].START = 1;
```

8.15.3 Limitations

The previous compare value is repeated if the PWM period is shorter than the time it takes for the EasyDMA to retrieve from RAM and update the internal compare registers. This is to ensure a glitch-free operation even for very short PWM periods.

Only SEQ[1] can trigger the **LOOPSDONE** event upon completion, not SEQ[0]. This requires looping to be enabled (**LOOP** > 0) and SEQ[1].MAXCNT > 0 when sequence playback starts.

8.15.4 Pin configuration

The OUT[n] (n=0..3) signals associated with each PWM channel are mapped to physical pins according to the configuration of PSEL.OUT[n] registers. If PSEL.OUT[n].CONNECT is set to Disconnected, the associated PWM module signal will not be connected to any physical pins.

Once PWM has been enabled, the PSEL.OUT[n] registers take effect and PWM generation starts from the IDLEOUT register. PWM can then be started and sequences generated.

To ensure correct behavior in the PWM module, the pins that are used must be configured in the GPIO peripheral in the following way before the PWM module is enabled:

PWM signal	PWM pin	Direction	Output value	Comment
OUT[n]	As specified in PSEL.OUT[n] (n=0..3)	Output	0	Idle state defined in GPIO OUT register and the IDLEOUT register

Table 48: Recommended GPIO configuration before starting PWM generation

The idle state of a pin is defined by the OUT register in the GPIO module and the IDLEOUT register, to ensure that the pins used by the PWM module are driven correctly. Both OUT register in the GPIO module and the IDLEOUT register should be set with same value for each PWM channel before enabling the PWM module. When PWM is disabled using the ENABLE register the PWM module stops controlling the GPIO pins, and the corresponding pins are then controlled by the GPIO peripheral.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

8.15.5 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
PWM20 : S	GLOBAL	0x500D2000	US	S	SA	No	Pulse width modulation unit PWM20
PWM20 : NS		0x400D2000					
PWM21 : S	GLOBAL	0x500D3000	US	S	SA	No	Pulse width modulation unit PWM21
PWM21 : NS		0x400D3000					
PWM22 : S	GLOBAL	0x500D4000	US	S	SA	No	Pulse width modulation unit PWM22
PWM22 : NS		0x400D4000					

Configuration

Instance	Domain	Configuration
PWM20 : S PWM20 : NS	GLOBAL	Use GPIO port P1 or P3
		IDLEOUT register is available.
		EVENTS_COMPAREMATCH events are available.
		CURRENTAMOUNT register included.
PWM21 : S PWM21 : NS	GLOBAL	Use GPIO port P1 or P3
		IDLEOUT register is available.
		EVENTS_COMPAREMATCH events are available.
		CURRENTAMOUNT register included.
PWM22 : S PWM22 : NS	GLOBAL	Use GPIO port P1 or P3
		IDLEOUT register is available.
		EVENTS_COMPAREMATCH events are available.
		CURRENTAMOUNT register included.

Register overview

Register	Offset	TZ	Description
TASKS_STOP	0x004		Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback
TASKS_NEXTSTEP	0x008		Steps by one value in the current sequence on all enabled channels if DECODER.MODE=NextStep. Does not cause PWM generation to start if not running.
TASKS_DMA.SEQ[n].START	0x010		Starts operation using easyDMA to load the values. See peripheral description for operation using easyDMA.
SUBSCRIBE_STOP	0x084		Subscribe configuration for task STOP
SUBSCRIBE_NEXTSTEP	0x088		Subscribe configuration for task NEXTSTEP
SUBSCRIBE_DMA.SEQ[n].START	0x090		Subscribe configuration for task START
EVENTS_STOPPED	0x104		Response to STOP task, emitted when PWM pulses are no longer generated
EVENTS_SEQSTARTED[n]	0x108		First PWM period started on sequence n
EVENTS_SEQEND[n]	0x110		Emitted at end of every sequence n, when last value from RAM has been applied to wave counter
EVENTS_PWMPERIODEND	0x118		Emitted at the end of each PWM period
EVENTS_LOOPSDONE	0x11C		Concatenated sequences have been played the amount of times defined in LOOP.CNT
EVENTS_RAMUNDERFLOW	0x120		Emitted when retrieving from RAM does not complete in time for the PWM module
EVENTS_DMA.SEQ[n].END	0x124		Generated after all MAXCNT bytes have been transferred
EVENTS_DMA.SEQ[n].READY	0x128		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.SEQ[n].BUSERROR	0x12C		An error occurred during the bus transfer.
EVENTS_COMPAREMATCH[n]	0x13C		This event is generated when the compare matches for the compare channel [n].
PUBLISH_STOPPED	0x184		Publish configuration for event STOPPED
PUBLISH_SEQSTARTED[n]	0x188		Publish configuration for event SEQSTARTED[n]
PUBLISH_SEQEND[n]	0x190		Publish configuration for event SEQEND[n]
PUBLISH_PWMPERIODEND	0x198		Publish configuration for event PWMPERIODEND
PUBLISH_LOOPSDONE	0x19C		Publish configuration for event LOOPSDONE
PUBLISH_RAMUNDERFLOW	0x1A0		Publish configuration for event RAMUNDERFLOW
PUBLISH_DMA.SEQ[n].END	0x1A4		Publish configuration for event END
PUBLISH_DMA.SEQ[n].READY	0x1A8		Publish configuration for event READY
PUBLISH_DMA.SEQ[n].BUSERROR	0x1AC		Publish configuration for event BUSERROR
PUBLISH_COMPAREMATCH[n]	0x1BC		Publish configuration for event COMPAREMATCH[n]

Register	Offset	TZ	Description
SHORTS	0x200		Shortcuts between local events and tasks
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
ENABLE	0x500		PWM module enable register
MODE	0x504		Selects operating mode of the wave counter
COUNTERTOP	0x508		Value up to which the pulse generator counter counts
PRESCALER	0x50C		Configuration for PWM_CLK
DECODER	0x510		Configuration of the decoder
LOOP	0x514		Number of playbacks of a loop
IDLEOUT	0x518		Configure the output value on the PWM channel during idle
SEQ[n].REFRESH	0x528		Number of additional PWM periods between samples loaded into compare register
SEQ[n].ENDDelay	0x52C		Time added after the sequence
PSEL.OUT[n]	0x560		Output pin select for PWM channel n
DMA.SEQ[n].PTR	0x704		RAM buffer start address
DMA.SEQ[n].MAXCNT	0x708		Maximum number of bytes in channel buffer
DMA.SEQ[n].AMOUNT	0x70C		Number of bytes transferred in the last transaction, updated after the END event.
DMA.SEQ[n].CURRENTAMOUNT	0x710		Number of bytes transferred in the current transaction
DMA.SEQ[n].TERMINATEONBUSERROR	0x71C		Terminate the transaction if a BUSERROR event is detected.
DMA.SEQ[n].BUSERRORADDRESS	0x720		Address of transaction that generated the last BUSERROR event.

8.15.5.1 TASKS_STOP

Address offset: 0x004

Stops PWM pulse generation on all channels at the end of current PWM period, and stops sequence playback

Bit number					31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

8.16 QDEC — Quadrature decoder

The quadrature decoder peripheral (QDEC) provides buffered decoding of quadrature-encoded sensor signals. It is suitable for mechanical and optical sensors.

The main features of QDEC are the following:

- Digital waveform decoding from off-chip quadrature encoder
- Sample accumulation eliminating hard real-time requirements to be enforced on application
- Configurable sample period and accumulation to match application requirements
- Optional input debounce filters
- Optional LED output signal for optical encoders

Figure 88: Quadrature decoder configuration

8.16.1 Sampling and decoding

The QDEC decodes the output from an incremental motion encoder by sampling the QDEC phase input pins (A and B).

The off-chip quadrature encoder is an incremental motion encoder outputting two waveforms, phase A and phase B. The two output waveforms are always 90 degrees out of phase, meaning that one always changes level before the other. The direction of movement is indicated by the waveform that changes level first. Invalid transitions may occur, meaning the two waveforms simultaneously switch. This may occur if the wheel rotates too fast relative to the sample rate set for the decoder.

The QDEC decodes the output from the off-chip encoder by sampling the QDEC phase input pins (A and B) at a fixed rate as specified in the SAMPLEPER register.

If the SAMPLEPER value needs to be changed, the QDEC shall be stopped using the STOP task. SAMPLEPER can be then changed upon receiving the STOPPED event, and QDEC can be restarted using the START task. Failing to do so may result in unpredictable behavior.

It is good practice to only change registers LEDPOL, REPORTPER, DBFEN, and LEDPRE when the QDEC is stopped.

When started, the decoder continuously samples the two input waveforms and decodes these by comparing the current sample pair (n) with the previous sample pair (n-1).

The decoding of the sample pairs is described in the table below.

Previous sample pair(n-1)		Current samples pair(n)		SAMPLE register	ACC operation	ACCDBL operation	Description
A	B	A	B				
0	0	0	0	0	No change	No change	No movement
0	0	0	1	1	Increment	No change	Movement in positive direction
0	0	1	0	-1	Decrement	No change	Movement in negative direction
0	0	1	1	2	No change	Increment	Error: Double transition
0	1	0	0	-1	Decrement	No change	Movement in negative direction
0	1	0	1	0	No change	No change	No movement
0	1	1	0	2	No change	Increment	Error: Double transition
0	1	1	1	1	Increment	No change	Movement in positive direction
1	0	0	0	1	Increment	No change	Movement in positive direction
1	0	0	1	2	No change	Increment	Error: Double transition
1	0	1	0	0	No change	No change	No movement
1	0	1	1	-1	Decrement	No change	Movement in negative direction
1	1	0	0	2	No change	Increment	Error: Double transition
1	1	0	1	-1	Decrement	No change	Movement in negative direction
1	1	1	0	1	Increment	No change	Movement in positive direction
1	1	1	1	0	No change	No change	No movement

Table 49: Sampled value encoding

8.16.2 LED output

The LED output follows the sample period. The LED is switched on for a set period before sampling and then switched off immediately after. The period the LED is switched on before sampling is given in the LEDPRE register.

The LED output pin polarity is specified in the LEDPOL register.

When using off-chip mechanical encoders not requiring an LED, the LED output can be disabled by writing value 'Disconnected' to the CONNECT field of the PSEL.LED register. In this case, the QDEC will not acquire access to a pin for the LED output.

8.16.3 Debounce filters

Each of the two-phase inputs have digital debounce filters.

When enabled through the DBFEN register, the filter inputs are sampled at a fixed 1 MHz frequency during the entire sample period (which is specified in the SAMPLEPER register). The filters require all of the samples within this sample period to equal before the input signal is accepted and transferred to the output of the filter.

As a result, only input signal with a steady state longer than twice the period specified in SAMPLEPER are guaranteed to pass through the filter. Any signal with a steady state shorter than SAMPLEPER will always be suppressed by the filter. It is assumed that the frequency during the debounce period never exceeds 500 kHz (as required by the Nyquist theorem when using a 1 MHz sample frequency).

The LED will always be ON when the debounce filters are enabled, as the inputs in this case will be sampled continuously.

When the debounce filters are enabled, displacements reported by the QDEC peripheral are delayed by one SAMPLEPER period.

8.16.4 Accumulators

The quadrature decoder contains two accumulator registers, ACC and ACCDBL. These registers accumulate valid motion sample values and the number of detected invalid samples (double transitions), respectively.

The ACC register accumulates all valid values (1/-1) written to the SAMPLE register. This can be useful for preventing hard real-time requirements from being enforced on the application. When using the ACC register, the application can fetch data when necessary instead of reading all SAMPLE register output. The ACC register holds the relative movement of the external mechanical device from the previous clearing of the ACC register. Sample values indicating a double transition (2) will not be accumulated in the ACC register.

An ACCOF event is generated if the ACC receives a SAMPLE value that would cause the register to overflow or underflow. Any SAMPLE value that would cause an ACC overflow or underflow will be discarded, but any samples that do not cause the ACC to overflow or underflow will still be accepted.

The accumulator ACCDBL accumulates the number of detected double transitions since the previous clearing of the ACCDBL register.

The ACC and ACCDBL registers can be cleared by the READCLRACC and subsequently read using the ACCREAD and ACCDBLREAD registers.

The ACC register can be separately cleared by the RDCLRACC and subsequently read using the ACCREAD registers.

The ACCDBL register can be separately cleared by the RDCLRDBL and subsequently read using the ACCDBLREAD registers.

The REPORTPER register allows automated capture of multiple samples before sending an event. When a non-null displacement is captured and accumulated, a REPORTRDY event is sent. When one or more double-displacements are captured and accumulated, a DBLRDY event is sent. The REPORTPER field in this register determines how many samples must be accumulated before the contents are evaluated and a REPORTRDY or DBLRDY event is sent.

Using the RDCLRACC task (manually sent upon receiving the event, or using the DBLRDY_RDCLRACC shortcut), ACCREAD can then be read.

When a double transition has been captured and accumulated, a DBLRDY event is sent. Using the RDCLRDBL task (manually sent upon receiving the event, or using the DBLRDY_RDCLRDBL shortcut), ACCDBLREAD can then be read.

8.16.5 Output/input pins

The QDEC uses a three-pin interface to the off-chip quadrature encoder.

These pins are acquired when the QDEC is enabled in the ENABLE register. The pins acquired by the QDEC cannot be written by the CPU, but they can still be read by the CPU.

The pin numbers used for the QDEC are selected using the PSEL.n registers.

8.16.6 Pin configuration

The Phase A, Phase B, and LED signals are mapped to physical pins according to the configuration specified in the PSEL.A, PSEL.B, and PSEL.LED registers respectively.

If the CONNECT field value 'Disconnected' is specified in any of these registers, the associated signal will not be connected to any physical pin. The PSEL.A, PSEL.B, and PSEL.LED registers and their configurations are only used as long as the QDEC is enabled, and retained only as long as the device is in ON mode. When the peripheral is disabled, the pins will behave as regular GPIOs, and use the configuration in their respective OUT bit field and PIN_CNF[n] register.

To secure correct behavior in the QDEC, the pins used by the QDEC must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 448 before enabling the QDEC. This configuration must be retained in the GPIO for the selected I/Os as long as the QDEC is enabled.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

QDEC signal	QDEC pin	Direction	Output value	Comment
Phase A	As specified in PSEL.A	Input	Not applicable	
Phase B	As specified in PSEL.B	Input	Not applicable	
LED	As specified in PSEL.LED	Input	Not applicable

8.17 RADIO — 2.4 GHz radio

The 2.4 GHz radio transceiver is compatible with multiple radio standards such as Bluetooth Low Energy, IEEE 802.15.4, and Nordic's proprietary protocols.

The main features of the RADIO peripheral are the following:

- Multidomain 2.4 GHz radio transceiver, with
 - Bluetooth Low Energy 1 Mbps and 2 Mbps modes
 - Bluetooth Low Energy Long Range (125 kbps and 500 kbps) modes
 - IEEE 802.15.4 250 kbps mode
 - 1 Mbps, 2 Mbps and 4 Mbps Nordic proprietary modes
- Best in class link budget and low power operation
- Efficient data interface with EasyDMA support
- Automatic address filtering and pattern matching
- Automated packet assembler/disassembler
- Automated CRC generator and checker

EasyDMA, in combination with an automated packet assembler, packet disassembler, automated CRC generator and CRC checker, makes it easy to configure and use RADIO. See the following figure for details.

Figure 89: RADIO block diagram

RADIO includes a device address match unit and an interframe spacing control unit that can be utilized to simplify device filtering and interframe spacing respectively in Bluetooth Low Energy and similar applications.

RADIO also includes a received signal strength indicator (RSSI) and a bit counter. The bit counter generates events when a preconfigured number of bits are sent or received by RADIO.

8.17.1 Packet configuration

A RADIO packet contains the fields PREAMBLE, ADDRESS, S0, LENGTH, S1, PAYLOAD, and CRC. For Long Range (125 kbps and 500 kbps) Bluetooth Low Energy modes, fields CI, TERM1, and TERM2 are also included.

The content of a RADIO packet is illustrated in the following figures. RADIO sends the fields in the packet according to the sequence shown in the figures, starting on the left.

Figure 90: On-air packet layout

Figure 91: On-air packet layout for Long Range (125 kbps and 500 kbps) Bluetooth Low Energy modes

Not shown in the figures is the static payload add-on (the length of which is defined in [PCNF1.STATLEN](#), and which is 0 bytes in a standard BLE packet). The static payload add-on is sent between PAYLOAD and CRC fields. RADIO sends the different fields in the packet in the order they are illustrated above, from left to right.

PREAMBLE is sent with least significant bit first on air. The size of the PREAMBLE depends on the mode selected in the [MODE](#) register, and is configured using [PCNF0.PLEN](#).

MODE	Preamble size (octets)	Preamble	
		When first bit of ADDRESS is 0	When first bit of ADDRESS is 1
Ble_1Mbit	1	0xAA	0x55
Nrf_1Mbit	1	0xAA	0x55
Nrf_2Mbit	1	0xAA	0x55
Ble_2Mbit	2	0xAAAA	0x5555
Nrf_4Mbit_OBT4	2	0xAAAA	0x5555
Nrf_4Mbit_OBT6	2	0xAAAA	0x5555
Ble_LR125Kbit	Any	10 repetitions of 0x3C	
Ble_LR500Kbit	Any	10 repetitions of 0x3C	
ieee802154_250Kbit	Any	4 repetitions of 0x00	

Table 51: Preamble size according to mode

Radio packets are stored in memory inside instances of a RADIO packet data structure as shown in the following figure. The PREAMBLE, ADDRESS, CI, TERM1, TERM2, and CRC fields are omitted in this data structure. Fields S0, LENGTH, and S1 are optional.

Figure 92: Representation of a RADIO packet in RAM

The byte ordering on air is always least significant byte first for the ADDRESS and PAYLOAD fields, and most significant byte first for the CRC field. The ADDRESS fields are always transmitted and received least significant bit first. The CRC field is always transmitted and received most significant bit first. The endianness, meaning the order in which the bits are sent and received, of the S0, LENGTH, S1, and PAYLOAD fields can be configured via [PCNF1.ENDIAN](#).

The sizes of the S0, LENGTH, and S1 fields can be individually configured via S0LEN, LFLen, and S1LEN in [PCNF0](#), respectively. If any of these fields are configured to be less than 8 bits, the least significant bits of the fields are used.

If S0, LENGTH, or S1 are specified with zero length, their fields will be omitted in memory. Otherwise, each field will be represented as a separate byte, regardless of the number of bits in their on-air counterpart.

Independent of the configuration of [PCNF1.MAXLEN](#), the combined length of S0, LENGTH, S1, and PAYLOAD cannot exceed 258 bytes.

8.17.2 Address configuration

The on-air radio ADDRESS field is composed of two parts, the base address field and the address prefix field.

The size of the base address field is configurable via the [PCNF1.BALEN](#) register. The base address is truncated from the least significant byte if [PCNF1.BALEN](#) is less than 4. See [Definition of logical addresses](#) on page 466.

The on-air addresses are defined in the [BASE0/BASE1](#) registers and [PREFIX0/PREFIX1](#) registers. It is only when writing these registers that the user must relate to the actual on-air addresses. For other

The CRC polynomial is configurable as illustrated in the following figure, where bit 0 in the register **CRCPOLY** corresponds to X^0 and bit n corresponds to X^n . See **CRCPOLY** on page 545 for more information.

Figure 94: n bit CRC generation

The figure shows that the CRC is calculated by feeding the packet serially through the CRC generator. Before the packet is clocked through the CRC generator, the CRC generator's latches $b_{[0..n]}$ will be initialized with a predefined value specified in the register **CRCINIT**. After the whole packet has been clocked through the CRC generator, $b_{[0..n]}$ will hold the resulting CRC. This value will be used by RADIO during both transmission and reception. The CPU cannot read latches $b_{[0..n]}$ at any time. However, a received CRC can be read by the CPU via the register **RXCRC**.

The length (n) of the CRC is configurable, see **CRCNCF** for more information.

When the entire packet including the CRC has been received, and no errors were detected, RADIO generates the event **CRCOK**. If CRC errors were detected, the event **CRCERROR** is generated.

The CRC check status can be read from the register **CRCSTATUS** after a packet has been received.

8.17.5 Radio states

Tasks and events are used to control the operating state of RADIO when in RX mode or TX mode.

RADIO can enter the states described in the following table.

State	Description
DISABLED	No operations are going on inside RADIO and the power consumption is at a minimum
RXRU	RADIO is ramping up and preparing for reception
RXIDLE	RADIO is ready for reception to start
RX	Reception has been started and the addresses enabled in the RXADDRESSES register are being monitored
RXDISABLE	RADIO is disabling the receiver
SETTLE	RADIO is waiting for the PLL to settle
PLL	The PLL has settled
TXRU	RADIO is ramping up and preparing for transmission
TXIDLE	RADIO is ready for transmission to start
TX	RADIO is transmitting a packet
TXDISABLE	RADIO is disabling the transmitter

Table 53: RADIO state diagram

A simplified state diagram without the optional states SETTLE and PLL is shown in the following figure.

Figure 95: Radio states without PLL

A second state diagram is shown in the following figure. This diagram only contains the specific transitions involving SETTLE and PLL. This way of operating the RADIO enables keeping the PLL on and locked without enabling RX or TX.

Figure 96: Radio states, PLL only

This figure shows how the tasks and events relate to the RADIO peripheral's operation. RADIO does not prevent a task from being triggered from the wrong state. For example, if the **RXEN** task is triggered from

the RXDISABLE state, this may lead to unpredictable behavior. The **PAYLOAD** event is always generated, even if the payload is zero.

The END to START shortcut should not be used with IEEE 802.15.4 250 kbps mode. Use the PHYEND to START shortcut instead.

The END to START shortcut should not be used with Long Range (125 kbps and 500 kbps) Bluetooth Low Energy modes. Use the PHYEND to START shortcut instead.

8.17.6 Transmit sequence

Before RADIO can transmit a packet, it must first ramp-up in TX mode. See TXRU in [Radio states without PLL](#) on page 468 and [Transmit sequence](#) on page 469. A TXRU ramp-up sequence is initiated when the **TXEN** task is triggered. After RADIO has successfully ramped up, it will generate the **READY** event indicating that a packet transmission can be initiated. A packet transmission is initiated by triggering the **START** task. The **START** task can first be triggered after RADIO has entered into the TXIDLE state.

The following figure illustrates a single packet transmission where the CPU manually triggers the different tasks needed to control the flow of RADIO, meaning no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between **READY** and **START**, and between **PHYEND** and **DISABLE**. As illustrated in the following figure, RADIO will by default transmit an unmodulated carrier between **READY** and **START**, and between **PHYEND** and **DISABLED**.

Figure 97: Transmit sequence

The following figure shows a transmit sequence where no delay is introduced. RADIO is configured to use shortcuts between **READY** and **START**, and between **PHYEND** and **DISABLE**.

Figure 98: Transmit sequence using shortcuts to avoid delays

RADIO is able to send multiple packets one after the other without having to disable and re-enable RADIO between packets, as illustrated in the following figure.

Figure 99: Transmission of multiple packets

8.17.7 Receive sequence

Before RADIO is able to receive a packet, it must first ramp up in RX mode. See RXRU in [Radio states without PLL](#) on page 468 and [Receive sequence](#) on page 471 for more information.

An RXRU ramp-up sequence is initiated when the [RXEN](#) task is triggered. After RADIO has successfully ramped up, it will generate the [READY](#) event indicating that a packet reception can be initiated. A packet reception is initiated by triggering the [START](#) task. As illustrated in [Radio states without PLL](#) on page 468, the [START](#) task can first be triggered after RADIO has entered the RXIDLE state.

The following figure shows a single packet reception where the CPU manually triggers the tasks needed to control the flow of RADIO, meaning no shortcuts are used. If shortcuts are not used, a certain amount of delay caused by CPU execution is expected between [READY](#) and [START](#), and between [PHYEND](#) and [DISABLE](#). RADIO will be listening and possibly receiving undefined data, represented with an **X**, from [START](#) and until a packet with valid preamble (P) is received.

Figure 100: Receive sequence

The following figure shows a receive sequence where no delay is introduced. RADIO is configured to use shortcuts between **READY** and **START**, and between **PHYEND** and **DISABLE**.

Figure 101: Receive sequence using shortcuts to avoid delays

RADIO can receive consecutive packets without having to disable and re-enable RADIO between packets, as illustrated in the following figure.

Figure 102: Reception of multiple packets

8.17.8 Received signal strength indicator (RSSI)

RADIO implements a mechanism for measuring the power in the received signal. This feature is called received signal strength indicator (RSSI).

The RSSI is continuously measured and the value filtered using a single-pole IIR filter. After a signal level change, the RSSI will settle after approximately `RSSISETTLE`.

Sampling the received signal strength is started by using the `RSSISTART` task. The sample can be read from the `RSSISAMPLE` register.

The sample period of the RSSI is defined by `RSSIPERIOD`. The `RSSISAMPLE` will hold the filtered received signal strength after this sample period.

For the RSSI sample to be valid, RADIO has to be enabled in RX mode by triggering the `RXEN` task and the reception has to be started with the `READY` event followed by `START` task.

8.17.9 Interframe spacing (IFS)

Interframe spacing (IFS) is defined as the time in microseconds between two consecutive packets, starting from when the end of the last bit of the previous packet is received, to the beginning of the first bit of the subsequent packet that is transmitted.

RADIO can enforce this interval, as specified in the `TIFS` register, as long as the `TIFS` register is not specified to be shorter than the RADIO peripheral's turnaround time (meaning the time needed to switch off the receiver and then switch on the transmitter). The `TIFS` register can be written any time before the last bit on air is received.

This timing is illustrated in the following figure.

Figure 103: IFS timing detail

The TIFS duration starts after the last bit on air (at the **PHYEND** event), and elapses with the first bit being transmitted on air (just after **READY** event).

TIFS is only enforced if the shortcuts **PHYEND** to **DISABLE** and **DISABLED** to **TXEN** or **PHYEND** to **DISABLE** and **DISABLED** to **RXEN** are enabled. The short **READY** to **START** must also be enabled. In these configurations, **TXEN** or **RXEN** is automatically delayed to achieve the configured interframe spacing.

TIFS is qualified for use in IEEE 802.15.4 250kbps mode, Bluetooth Low Energy Long Range (125 kbps and 500 kbps) modes, and Bluetooth Low Energy 1 Mbps and 2 Mbps modes, using the Legacy ramp-up mode.

SHORTS and **TIFS** registers are not double-buffered and can be updated at any point before the last bit on air is received.

8.17.10 Device address match

The device address match feature is tailored for device filtering in Bluetooth Low Energy and similar implementations.

This feature enables on-the-fly device address matching while receiving a packet over-the-air. This feature only works in RX mode and when RADIO is configured for little endian, see **PCNF1.ENDIAN** for more information.

The device address match unit assumes that the first 48 bits of the payload are the device address and that bit number 6 in S0 is the TxAdd bit. See the *Bluetooth Core Specification* for more information about device addresses, TxAdd, and the device filtering procedure.

RADIO is able to listen for eight different device addresses at the same time. These addresses are specified in a DAB/DAP register pair, one pair per address, in addition to a TxAdd bit configured in the DACNF register. The DAB register specifies the 32 least significant bits of the device address, while the DAP register specifies the 16 most significant bits of the device address.

Each of the device addresses can be individually included or excluded from the matching mechanism. This is configured in the **DACNF** register.

8.17.11 Bit counter

RADIO implements a simple counter that can be configured to generate an event after a specific number of bits has been transmitted or received.

By using shortcuts, this counter can be started from different events generated by RADIO and count relative to these events.

The bit counter is started by triggering the **BCSTART** task, and stopped by triggering the **BCSTOP** task. A **BCMATCH** event will be generated when the bit counter has counted the bits specified in register **BCC**. The bit counter will continue to count bits until the **DISABLED** event is generated or until the **BCSTOP** task is triggered. After the **BCMATCH** event, the CPU can reconfigure the value **BCC** for new **BCMATCH** events within the same packet.

The bit counter can only be started after RADIO has received the **ADDRESS** event.

The bit counter will stop and reset for the tasks **BCSTOP**, **STOP**, or **DISABLE**, or the event **END**.

The following figure shows how the bit counter can be used to generate the **BCMATCH** event in the beginning of the packet payload, and again generate a second **BCMATCH** event after sending 2 bytes (16 bits) of the payload.

Figure 104: Bit counter example

RXRU assumes that the total combined length of S0, L, and S1 is 12 bits.

8.17.12 IEEE 802.15.4 operation

The IEEE standard 802.15.4 differs from the Nordic proprietary and Bluetooth Low Energy modes. Differences include modulation scheme, channel structure, packet structure, security, and medium access control.

The following are the main features of the IEEE 802.15.4 mode:

- Ultra-low power 250 kbps, 2450 MHz, IEEE 802.15.4-2020 compliant link
- Clear channel assessment (CCA)
- Energy detection (ED) scan
- CRC generation

To enable RADIO to comply with the IEEE 802.15.4-2020 standard, set **MODE** = `ieee802154_250kbit`.

8.17.12.1 Packet structure

IEEE 802.15.4 defines an on-the-air frame/packet that is different from what is used in Bluetooth Low Energy.

The following figure provides an overview of the physical frame structure and its timing.

Figure 105: IEEE 802.15.4 frame format (PPDU)

The standard uses the term octet for an 8-bit storage unit within the PPDU. For timing, the value `symbol` is used, and it has a duration of 16 μ s.

The total usable payload (PSDU) is 127 octets, but when CRC is in use, this is reduced to 125 octets of usable payload.

The preamble sequence consists of four octets that are all 0 and are used for synchronizing the RADIO peripheral's receiver. Following the preamble is the single octet start of frame delimiter (SFD), with a fixed value of 0xA7. An alternate SFD can be programmed through the `SFD` register, providing an initial level of frame filtering when non-standard compliance is chosen. It is a valuable feature when operating in a congested or private network. The preamble sequence and the SFD are generated by RADIO and are not programmed by the user into the frame buffer.

Following the five octet synchronization header (SHR) is the single octet PHY header (PHR). The least significant seven bits of PHR denote the frame length of the following PSDU. The most significant bit is reserved and is set to 0 for frames that are standard compliant. RADIO reports all eight bits which can be used to carry additional information. The PHR is the first byte written to the frame data memory pointed to by `PACKETPTR`. Frames with zero length are discarded, and the `FRAMESTART` event is not generated in this case.

The next N octets carry the data of the PHY packet, where N equals the value of the PHR. For an implementation also using the IEEE 802.15.4 medium access control (MAC) layer, the PHY data is a MAC frame of N-2 octets, because two octets occupy a CRC field.

An IEEE 802.15.4 MAC layer frame consists of the following:

- A header, which is composed of the following:
 - The frame control field (FCF)
 - The sequence number
 - Addressing fields
- A payload
- The 16-bit frame control sequence (FCS)

Figure 106: IEEE 802.15.4 frame format (MPDU)

The two FCF octets contain information about the frame type, addressing, and other control flags. This field is decoded when using the assisted operating modes offered by RADIO.

The sequence number is a single octet in size and is unique for a frame. It is used in the associated acknowledgement frame sent upon successful frame reception.

The addressing field can be zero (acknowledgement frame) or up to 20 octets in size. The field is used to direct packets to the correct recipient and denote its origin. IEEE 802.15.4 bases its addressing on networks being organized in PANs with 16-bit identifier and nodes having a 16-bit or 64-bit address. In the assisted receive mode, these parameters are analyzed for address matching and acknowledgement.

The MAC payload carries the data of the next higher layer, or in the case of a MAC command frame, information used by the MAC layer itself.

The two last octets contain the 16-bit ITU-T CRC. The FCS is calculated over the MAC header (MHR) and MAC payload (MSDU) parts of the frame. This field is calculated automatically when sending a frame, or indicated in the [CRCSTATUS](#) register when a frame is received. If configured, this feature is maintained autonomously by the CRC module.

8.17.12.2 Operating frequencies

IEEE 802.15.4 defines 16 channels in the 2450 MHz frequency band. The channels are numbered from 11 to 26, each with a width of 5 MHz.

To choose the correct channel center frequency, the [FREQUENCY](#) register must be programmed according to the following table.

IEEE 802.15.4 channel	Center frequency (MHz)	FREQUENCY setting
Channel 11	2405	5
Channel 12	2410	10
Channel 13	2415	15
Channel 14	2420	20
Channel 15	2425	25
Channel 16	2430	30
Channel 17	2435	35
Channel 18	2440	40
Channel 19	2445	45
Channel 20	2450	50
Channel 21	2455	55
Channel 22	2460	60
Channel 23	2465	65
Channel 24	2470	70
Channel 25	2475	75
Channel 26	2480	80

Table 54: IEEE 802.15.4 center frequency definition

8.17.12.3 Energy detection (ED)

In order to determine the presence of activity, IEEE 802.15.4 requires that the received signal power within the channel bandwidth can be sampled.

To prevent the channel signal from being decoded, the shortcut between the **READY** event and the **START** task should be disabled before putting RADIO in RX mode. The energy detection (ED) measurement time, where RSSI samples are averaged, is 8 symbol periods, corresponding to 128 μ s. The standard further specifies the measurement to be a number between 0 and 255, where 0 indicates received power less than 10 dB above the selected receiver sensitivity. The power range of the ED values must be at least a 40 dB linear mapping with accuracy of ± 6 dB. See section 6.9.7 *Receiver ED* in IEEE 802.15.4 for further details.

The following example shows how to perform a single energy detection measurement and convert to IEEE 802.15.4 scale.

IEEE 802.15.4 ED measurement example

```
#define ED_RSSISCALE 4 // From electrical specifications
uint8_t sample_ed(void)
{
    int val;
    NRF_RADIO->TASKS_EDSTART = 1; // Start
    while (NRF_RADIO->EVENTS_EDEND != 1) {
        // CPU can sleep here or do something else
        // Use of interrupts are encouraged
    }
    val = NRF_RADIO->EDSAMPLE * ED_RSSISCALE; // Read level
    return (uint8_t)(val > 255 ? 255 : val); // Convert to IEEE 802.15.4 scale
}
```

For scaling between hardware value and dBm, see [Clear channel assessment \(CCA\)](#) on page 478.

The `mlme-scan.req` primitive of the MAC layer uses the ED measurement to detect channels where there might be wireless activity. To assist this primitive, a tailored mode of operation is available where the ED measurement runs for a defined number of iterations keeping track of the maximum ED level. This is engaged by writing the `EDCNT` field of the `EDCTRL` register to a value different from 0, where it will run the specified number of iterations and report the maximum energy measurement in the `EDSAMPLE` register. The scan is started with the `EDSTART` task and the end indicated with the `EDEND` event. This significantly reduces the interrupt frequency and therefore power consumption. The following figure shows how the ED measurement will operate depending on the `EDCNT` and `EDPERIOD` fields of the `EDCTRL` register.

Figure 107: Energy detection measurement for a single iteration ($EDCNT = 0$)

Figure 108: Energy detection measurement example with multiple iterations

The scan is stopped by writing the `EDSTOP` task. It is followed by the `EDSTOPPED` event when the module has terminated.

8.17.12.4 Clear channel assessment (CCA)

IEEE 802.15.4 implements a listen-before-talk channel access method to avoid collisions when transmitting. This is known as carrier sense multiple access with collision avoidance (CSMA-CA). The key part of this method is measuring if the wireless medium is busy or not.

The following clear channel assessment modes are supported:

- CCA Mode 1 (energy above threshold) – The medium is reported busy upon detecting any energy above the ED threshold.

- CCA Mode 2 (carrier sense only) – The medium is reported busy upon detection of a signal compliant with IEEE 802.15.4 with the same modulation and spreading characteristics.
- CCA Mode 3 (carrier sense with energy above threshold) – The medium is reported busy using a logical combination (AND/OR) between the results from CCA Mode 1 and CCA Mode 2.

The clear channel assessment should survey a period equal to 8 symbols or 128 μ s.

RADIO must be in RX mode and be able to receive correct packets when performing the CCA. The shortcut between **READY** and **START** must be disabled if baseband processing is not to be performed while the measurement is running.

Register **EDSAMPLE** on page 531 is updated at the end of the clear channel assessment and can be used to read the energy level measured during the procedure. For **CCACTRL.CCAMODE** = EdModeEdModeTest1, **EDSAMPLE** holds the first ED measurement. For the other CCA modes, **EDSAMPLE** holds the average ED value.

CCA Mode 1

CCA Mode 1 is enabled by first configuring the field **CCACTRL.CCAMODE** = EdMode and writing the **CCACTRL.CCAEDTHRES** field to a chosen value. Once the **CCASTART** task is written, RADIO will perform an ED measurement for 8 symbols and compare the measured level with that found in the **CCACTRL.CCAEDTHRES** field. If the measured value is higher than or equal to this threshold, the **CCABUSY** event is generated. If the measured level is less than the threshold, the **CCAIDLE** event is generated.

CCA Mode 2

CCA Mode 2 is enabled by configuring the field **CCACTRL.CCAMODE** = CarrierMode. RADIO will sample to see if a valid SFD is found during the 8 symbols. If a valid SFD is detected, the **CCABUSY** event is generated and the device should not send any data. The **CCABUSY** event is also generated if the scan was performed during an ongoing frame reception. If the measurement period completes with no SFD detection, the **CCAIDLE** event is generated. When **CCACTRL.CCACORRCNT** is not zero, the algorithm will look at the correlator output in addition to the SFD detection signal. If an SFD is reported during the scan period, it will terminate immediately indicating busy medium. Similarly, if the number of peaks above **CCACTRL.CCACORRTHRES** crosses the **CCACTRL.CCACORRCNT**, the **CCACTRL.CCABUSY** event is generated. If less than **CCACORRCOUNT** crossings are found and no SFD is reported, the **CCAIDLE** event will be generated and the device can send data.

CCA Mode 3

CCA Mode 3 is enabled by configuring **CCACTRL.CCAMODE** = CarrierAndEdMode or **CCACTRL.CCAMODE** = CarrierOrEdMode and performing the required logical combination of the result from CCA Mode 1 and CCA Mode 2. The **CCABUSY** or **CCAIDLE** events are generated by ANDing or ORing the energy above threshold and carrier detection scans.

Shortcuts

An ongoing CCA can be stopped by issuing the **CCASTOP** task. This will trigger the associated **CCASTOPPED** event.

For CCA mode automation, the following shortcuts are available:

- To automatically switch between RX mode (when performing the CCA) and to TX mode where the packet is sent, the shortcut between **CCAIDLE** and **TXEN**, in conjunction with the short between **CCAIDLE** and **STOP**, must be used.
- To automatically disable RADIO whenever the CCA reports a busy medium, the shortcut between **CCABUSY** and **DISABLE** can be used.

- To immediately start a CCA after ramping up into RX mode, the shortcut between **RXREADY** and **CCASTART** can be used.

Conversion

The conversion from a CCAEDTHRES, LQI, or EDSAMPLE value to dBm can be done with the following equation, where $VAL_{HARDWARE}$ is either CCAEDTHRES, LQI, or EDSAMPLE. LQI and EDSAMPLE are hardware-reported values, while CCAEDTHRES is set by software. Constants ED_RSSISCALE and ED_RSSIOFFS are from the electrical specifications.

$$P_{RF}[dBm] = ED_RSSIOFFS + VAL_{HARDWARE}$$

The ED_RSSISCALE constant is used to calculate power in 802.15.4 units (0-255), using the following formula:

$$P_{RF}[802.15.4 \text{ units}] = \text{MIN}(ED_RSSISCALE \times VAL_{HARDWARE}, 255)$$

8.17.12.5 Cyclic redundancy check (CRC)

IEEE 802.15.4 uses a 16-bit ITU-T cyclic redundancy check (CRC) calculated over the MAC header (MHR) and MAC service data unit (MSDU).

The standard defines the following generator polynomial:

$$G(x) = x^{16} + x^{12} + x^5 + 1$$

In RX mode, RADIO will trigger the CRC module when the first octet after the frame length (PHR) is received. The CRC will then update on each consecutive octet received. When a complete frame is received, the **CRCSTATUS** register will be updated accordingly and the **CRCOK** or **CRCERROR** events will be generated. When the CRC module is enabled, it will not write the two last octets (CRC) to the frame RAM. When transmitting, the CRC will be computed on the fly, starting with the first octet after PHR, and inserted as the two last octets in the frame. The EasyDMA will fetch the frame length minus 2 octets from RAM and insert the CRC octets at their correct positions in the frame.

The following code shows how to configure the CRC module for correct operation when in IEEE 802.15.4 mode. The **CRC CNF** is written to 16-bit CRC and the **CRC POLY** is written to 0x11021. The start value used by IEEE 802.15.4 is 0 and **CRC INIT** is configured to reflect this.

```
/* 16-bit CRC with ITU-T polynomial with 0 as start condition*/
NRF_RADIO->CRCCNF = ((RADIO_CRCCNF_SKIPADDR_Ieee802154 << RADIO_CRCCNF_SKIPADDR_Pos) |
                    (RADIO_CRCCNF_LEN_Two << RADIO_CRCCNF_LEN_Pos));
NRF_RADIO->CRCPOLY = 0x11021;
NRF_RADIO->CRCINIT = 0;
```

The ENDIANESS subregister must be set to little-endian since the FCS field is transmitted from the left bit to the right bit.

8.17.12.6 Transmit sequence

The transmission is started by first putting RADIO in RX mode and triggering the **RXEN** task .

An outline of the IEEE 802.15.4 transmission is illustrated in the following figure.

Figure 109: IEEE 802.15.4 transmit sequence

The receiver will ramp up and enter the RXIDLE state where the **READY** event is generated. Upon receiving the **READY** event, the CCA is started by triggering the **CCASTART** task. The chosen mode of assessment (register **CCACTRL.CCAMODE**) will be performed and signal the **CCAIDLE** event or **CCABUSY** event 128 μ s later. If the event **CCABUSY** is received, RADIO will have to retry the CCA after a specific back-off period. This is outlined in the *IEEE 802.15.4 standard, Figure 69 in section 7.5.1.4 The CSMA-CA algorithm*.

If the event **CCAIDLE** is generated, a write to the task register **TXEN** enters RADIO in TXRU state. The **READY** event will be generated when RADIO is in the TXIDLE state and ready to transmit. With the **PACKETPTR** pointing to the length (PHR) field of the frame, the **START** task can be written. RADIO will send the four octet preamble sequence followed by the start of frame delimiter (register **SFD**). The first byte read from RAM is the length field (PHR) followed by the transmission of the number of bytes indicated as the frame length. If the CRC module is configured, it will run for PHR-2 octets. The last two octets will be substituted with the results from running the CRC. The necessary CRC parameters are sampled on the **START** task. The FCS field of the frame is little endian.

In addition to the available shortcuts, one is provided between the **READY** event and the **CCASTART** task so that a CCA can automatically start when the receiver is ready. A second shortcut has been added between the **CCAIDLE** event and the **TXEN** task, when a clear channel is detected, RADIO can immediately enter TX mode.

8.17.12.7 Receive sequence

RADIO must be in RX mode before the receive sequence can begin. After writing to the **RXEN** task, RADIO will start ramping up and enter the RXRU state.

When the **READY** event is generated, RADIO enters the RXIDLE mode. For the baseband processing to be enabled, the **START** task must be written. An outline of the IEEE 802.15.4 receive sequence can be found in the following figure.

Figure 110: IEEE 802.15.4 receive sequence

When a valid SHR is received, RADIO will start storing future octets (starting with PHR) to the data memory pointed to by [PACKETPTR](#). After the SFD octet is received, the [FRAMESTART](#) event is generated. If the CRC module is enabled, it will start updating with the second byte received (first byte in payload) and run for the full frame length. The two last bytes in the frame are not written to RAM when CRC is configured. However, if the result of the CRC is zero after running the full frame, the [CRCOK](#) event will be generated. The [END](#) event is generated when the last octet has been received and is available in data memory.

When a packet is received, a link quality indicator (LQI) is generated and appended immediately after the last received octet. When using an IEEE 802.15.4 compliant frame, this will be just after the MSDU since the FCS is not reported. In the case of a non-compliant frame, it will be appended after the full frame. The LQI reported by the hardware must be converted to the IEEE 802.15.4 range by an 8-bit saturating multiplication of 4, as shown in [IEEE 802.15.4 ED measurement example](#) on page 478. The LQI is only valid for frames equal to, or longer than, three octets. When receiving a frame, the RSSI (reported as negative dB) will be measured at three points during the reception. These three values will be sorted with the middle value selected (median 3) to be remapped within the LQI range. The following figure illustrates the LQI measurement and how the data is arranged in data memory.

Figure 111: IEEE 802.15.4 frame in data memory

A shortcut has been added between the **FRAMESTART** event and the **BCSTART** task. This can be used to trigger a **BCMATCH** event after N bits, such as when inspecting the MAC addressing fields.

8.17.12.8 Interframe spacing (IFS)

IEEE 802.15.4 defines a specific time that is allotted for the MAC sublayer to process received data. The interframe spacing (IFS) is used to prevent two frames from being transmitted too close together. If the transmission is requesting an acknowledgement, the space before the second frame must be at least one IFS period.

IFS is determined to be one of the following:

- IFS = macMinSIFSPeriod (12 symbols) if MPDU $\leq$ aMaxSIFSFrameSize (18 octets) octets
- IFS = macMinLIFSPeriod (40 symbols) if MPDU > aMaxSIFSFrameSize

Using the efficient assisted modes in RADIO, the **TIFS** will be programmed with the correct value based on the frame being transmitted. If the assisted modes are not in use, the **TIFS** register must be updated manually. The following figure shows what IFS period is valid in both acknowledged and unacknowledged transmissions.

Acknowledged transmission

Unacknowledged transmission

Figure 112: Interframe spacing examples

8.17.13 EasyDMA

RADIO uses EasyDMA to read and write packets to RAM without CPU involvement.

As illustrated in [RADIO block diagram](#) on page 464, the RADIO peripheral's EasyDMA utilizes the same [PACKETPTR](#) for receiving and transmitting packets. This pointer should be reconfigured by the CPU each time before RADIO is started by the [START](#) task. The [PACKETPTR](#) register is double-buffered, meaning that it can be updated and prepared for the next transmission.

The [END](#) event indicates that the last bit has been processed by RADIO. The [DISABLED](#) event is issued to acknowledge that the [DISABLE](#) task is done.

The structure of a packet is described in detail in [Packet configuration](#) on page 464. The data that is stored in Data RAM and transported by EasyDMA consists of the following fields:

- S0
- LENGTH
- S1
- PAYLOAD

In addition, a static add-on is sent immediately after the payload.

The size of each of the listed fields in the frame is configurable (see [Packet configuration](#) on page 464), and the space occupied in RAM depends on these settings. The size of the field can be zero, as long as the resulting frame complies with the chosen RF protocol.

All fields are extended in size to align with a byte boundary in RAM. For instance, a 3-bit long field on-air will occupy 1 byte in RAM while a 9-bit long field will be extended to 2 bytes.

The packet's elements can be configured as follows:

- CI, TERM1, and TERM2 fields are only present in Bluetooth Low Energy Long Range mode
- S0 is configured through the field [PCNF0.SOLEN](#)
- LENGTH is configured through the field [PCNF0.LFLEN](#)
- S1 is configured through the field [PCNF0.S1LEN](#)
- Payload size is configured through the value in RAM corresponding to the LENGTH field
- Static add-on size is configured through the field [PCNF1.STATLEN](#)

The [PCNF1.MAXLEN](#) field configures the maximum packet payload plus add-on size in number of bytes that can be transmitted or received by RADIO. This feature can be used to ensure that RADIO does not overwrite or read beyond the RAM assigned to the packet payload. This means that if the LENGTH

field of the packet payload exceeds **PCNF1.STATLEN**, and the **LENGTH** field in the packet specifies a packet larger than configured in **PCNF1.MAXLEN**, the payload will be truncated to the length specified in **PCNF1.MAXLEN**.

Note: The **PCNF1.MAXLEN** field includes the payload and the add-on, but excludes the size occupied by the **S0**, **LENGTH**, and **S1** fields. This has to be taken into account when allocating RAM.

If the payload and add-on length is specified larger than **PCNF1.MAXLEN**, RADIO will transmit or receive in the same way as before, except the payload is now truncated to **PCNF1.MAXLEN**. The packet's **LENGTH** field will not be altered when the payload is truncated. RADIO will calculate CRC as if the packet length is equal to **PCNF1.MAXLEN**.

Note: If **PACKETPTR** is not pointing to the RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 13 for more information about the different memory regions.

The **END** event indicates that the last bit has been processed by RADIO. The **DISABLED** event is issued to acknowledge that the **DISABLE** task is done.

8.17.14 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
RADIO : S	GLOBAL	0x5008A000	US	S	SA	No	2.4 GHz radio RADIO
RADIO : NS		0x4008A000					See pinout for GPIO options for DFE antenna switch control

Configuration

Instance	Domain	Configuration
RADIO : S	GLOBAL	For the PSEL registers, use only dedicated pins on port P1
RADIO : NS		

Register overview

Register	Offset	TZ	Description
TASKS_TXEN	0x000		Enable RADIO in TX mode
TASKS_RXEN	0x004		Enable RADIO in RX mode
TASKS_START	0x008		Start RADIO
TASKS_STOP	0x00C		Stop RADIO
TASKS_DISABLE	0x010		Disable RADIO
TASKS_RSSISTART	0x014		Start the RSSI and take one single sample of the receive signal strength
TASKS_BCSTART	0x018		Start the bit counter
TASKS_BCSTOP	0x01C		Stop the bit counter
TASKS_EDSTART	0x020		Start the energy detect measurement used in IEEE 802.15.4 mode
TASKS_EDSTOP	0x024		Stop the energy detect measurement
TASKS_CCASTART	0x028		Start the clear channel assessment used in IEEE 802.15.4 mode
TASKS_CCASTOP	0x02C		Stop the clear channel assessment
TASKS_AUXDATADMASTART	0x038		Start DMA transaction of acquisition

Register	Offset	TZ	Description
TASKS_AUXDATADMASTOP	0x03C		Stop ongoing DMA transaction of acquisition
TASKS_PLEN	0x06C		Enable RADIO in PLL mode (standby for either TX or RX)
TASKS_CSTONESSTART	0x0A0		Start tone processing for channel sounding
TASKS_SOFTRESET	0x0A4		Reset all public registers, but with these exceptions: DMA registers and EVENT/INTEN/ SUBSCRIBE/PUBLISH registers. Only to be used in DISABLED state.
SUBSCRIBE_TXEN	0x100		Subscribe configuration for task TXEN
SUBSCRIBE_RXEN	0x104		Subscribe configuration for task RXEN
SUBSCRIBE_START	0x108		Subscribe configuration for task START
SUBSCRIBE_STOP	0x10C		Subscribe configuration for task STOP
SUBSCRIBE_DISABLE	0x110		Subscribe configuration for task DISABLE
SUBSCRIBE_RSSISTART	0x114		Subscribe configuration for task RSSISTART
SUBSCRIBE_BCSTART	0x118		Subscribe configuration for task BCSTART
SUBSCRIBE_BCSTOP	0x11C		Subscribe configuration for task BCSTOP
SUBSCRIBE_EDSTART	0x120		Subscribe configuration for task EDSTART
SUBSCRIBE_EDSTOP	0x124		Subscribe configuration for task EDSTOP
SUBSCRIBE_CCASTART	0x128		Subscribe configuration for task CCASTART
SUBSCRIBE_CCASTOP	0x12C		Subscribe configuration for task CCASTOP
SUBSCRIBE_AUXDATADMASTART	0x138		Subscribe configuration for task AUXDATADMASTART
SUBSCRIBE_AUXDATADMASTOP	0x13C		Subscribe configuration for task AUXDATADMASTOP
SUBSCRIBE_PLEN	0x16C		Subscribe configuration for task PLEN
SUBSCRIBE_CSTONESSTART	0x1A0		Subscribe configuration for task CSTONESSTART
SUBSCRIBE_SOFTRESET	0x1A4		Subscribe configuration for task SOFTRESET
EVENTS_READY	0x200		RADIO has ramped up and is ready to be started
EVENTS_TXREADY	0x204		RADIO has ramped up and is ready to be started TX path
EVENTS_RXREADY	0x208		RADIO has ramped up and is ready to be started RX path
EVENTS_ADDRESS	0x20C		Address sent or received
EVENTS_FRAMESTART	0x210		IEEE 802.15.4 length field received
EVENTS_PAYLOAD	0x214		Packet payload sent or received
EVENTS_END	0x218		Memory access for packet data has been completed
EVENTS_PHYEND	0x21C		The last bit is sent on air or last bit is received
EVENTS_DISABLED	0x220		RADIO has been disabled
EVENTS_DEVMATCH	0x224		A device address match occurred on the last received packet
EVENTS_DEVMISS	0x228		No device address match occurred on the last received packet
EVENTS_CRCOK	0x22C		Packet received with CRC ok
EVENTS_CRCERROR	0x230		Packet received with CRC error
EVENTS_BCMATCH	0x238		Bit counter reached bit count value
EVENTS_EDEND	0x23C		Sampling of energy detection complete (a new ED sample is ready for readout from the RADIO.EDSAMPLE register)
EVENTS_EDSTOPPED	0x240		The sampling of energy detection has stopped
EVENTS_CCAIDLE	0x244		Wireless medium in idle - clear to send
EVENTS_CCABUSY	0x248		Wireless medium busy - do not send
EVENTS_CCASTOPPED	0x24C		The CCA has stopped
EVENTS_RATEBOOST	0x250		Ble_LR CI field received, receive mode is changed from Ble_LR125Kbit to Ble_LR500Kbit
EVENTS_MHRMATCH	0x254		MAC header match found
EVENTS_SYNC	0x258		Initial sync detected
EVENTS_CTEPRESENT	0x25C		CTEInfo byte is received
EVENTS_PLLREADY	0x2B0		PLL has settled and RADIO is ready to be enabled in either TX or RX mode
EVENTS_RXADDRESS	0x2BC		Address received
EVENTS_AUXDATADMAEND	0x2C0		AUXDATA DMA end
EVENTS_CSTONESEND	0x2C8		The channel sounding tone processing is complete
PUBLISH_READY	0x300		Publish configuration for event READY
PUBLISH_TXREADY	0x304		Publish configuration for event TXREADY
PUBLISH_RXREADY	0x308		Publish configuration for event RXREADY

Register	Offset	TZ	Description
PUBLISH_ADDRESS	0x30C		Publish configuration for event ADDRESS
PUBLISH_FRAMESTART	0x310		Publish configuration for event FRAMESTART
PUBLISH_PAYLOAD	0x314		Publish configuration for event PAYLOAD
PUBLISH_END	0x318		Publish configuration for event END
PUBLISH_PHYEND	0x31C		Publish configuration for event PHYEND
PUBLISH_DISABLED	0x320		Publish configuration for event DISABLED
PUBLISH_DEVMATCH	0x324		Publish configuration for event DEVMATCH
PUBLISH_DEVMISS	0x328		Publish configuration for event DEVMISS
PUBLISH_CRCOK	0x32C		Publish configuration for event CRCOK
PUBLISH_CRCERROR	0x330		Publish configuration for event CRCERROR
PUBLISH_BCMATCH	0x338		Publish configuration for event BCMATCH
PUBLISH_EDEND	0x33C		Publish configuration for event EDEND
PUBLISH_EDSTOPPED	0x340		Publish configuration for event EDSTOPPED
PUBLISH_CCAIDLE	0x344		Publish configuration for event CCAIDLE
PUBLISH_CCABUSY	0x348		Publish configuration for event CCABUSY
PUBLISH_CCASTOPPED	0x34C		Publish configuration for event CCASTOPPED

PUBLISH_RXADDRESS	0x3BC		Publish configuration for event RXADDRESS
PUBLISH_AUXDATADMAEND	0x3C0		Publish configuration for event AUXDATADMAEND
PUBLISH_CSTONESEND	0x3C8		Publish configuration for event CSTONESEND
SHORTS	0x400		Shortcuts between local events and tasks
INTENSET00	0x488		Enable interrupt
INTENSET01	0x48C		Enable interrupt
INTENCLR00	0x490		Disable interrupt
INTENCLR01	0x494		Disable interrupt
INTENSET10	0x4A8		Enable interrupt
INTENSET11	0x4AC		Enable interrupt
INTENCLR10	0x4B0		Disable interrupt
INTENCLR11	0x4B4		Disable interrupt
MODE	0x500		Data rate and modulation
PHYENDTXDELAY	0x518		Configurable delay of PHYEND event for TX
STATE	0x520		Current radio state
EDCTRL	0x530		IEEE 802.15.4 energy detect control
EDSAMPLE	0x534		IEEE 802.15.4 energy detect level
CCACTRL	0x538		IEEE 802.15.4 clear channel assessment control
DATAWHITE	0x540		Data whitening configuration
AUXDATA.CNF[n]	0x548		AUXDATA configuration
AUXDATADMA[n].ENABLE	0x550		Enable or disable data acquisition
AUXDATADMA[n].PTR	0x554		DMA pointer
AUXDATADMA[n].MAXCNT	0x558		Maximum number of 32-bit words to transfer
AUXDATADMA[n].AMOUNT	0x55C		Number of 32-bit words transferred in the last transaction
TIMING	0x704		Timing
FREQUENCY	0x708		Frequency
TXPOWER	0x710		Output power
TIFS	0x714		Interframe spacing in μ s
RSSISAMPLE	0x718		RSSI sample
RXGAIN.CONFIG	0x7D4		Override configuration of receiver gain control loop
FREQFINETUNE	0x0804		Fine tuning of the RF frequency
FECONFIG	0x908		Config register

Register	Offset	TZ	Description
CFO_STAT	0xB00		Carrier freq. offset estimate
DBCCORR	0xB40		Correlator thresholds
DFEMODE	0xD00		Whether to use Angle-of-Arrival (AOA) or Angle-of-Departure (AOD)
DFESTATUS	0xD04		DfE status information
DFECTR1	0xD10		Various configuration for Direction finding
DFECTR2	0xD14		Start offset for Direction finding
SWITCHPATTERN	0xD28		GPIO patterns to be used for each antenna
CLEARPATTERN	0xD2C		Clear the GPIO pattern array for antenna control
PSEL.DFEGPIO[n]	0xD30		Pin select for DfE pin n
DFEPACKET.PTR	0xD50		Data pointer
DFEPACKET.MAXCNT	0xD54		Maximum number of bytes to transfer
DFEPACKET.AMOUNT	0xD58		Number of bytes transferred in the last transaction
DFEPACKET.CURRENTAMOUNT	0xD5C		Number of bytes transferred in the current transaction
CRCSTATUS	0xE0C		CRC status
RXMATCH	0xE10		Received address
RXCRC	0xE14		CRC field of previously received packet
DAI	0xE18		Device address match index
PDUSTAT	0xE1C		Payload status
PCNF0	0xE20		Packet configuration register 0
PCNF1	0xE28		Packet configuration register 1
BASE0	0xE2C		Base address 0
BASE1	0xE30		Base address 1
PREFIX0	0xE34		Prefixes bytes for logical addresses 0-3
PREFIX1	0xE38		Prefixes bytes for logical addresses 4-7
TXADDRESS	0xE3C		Transmit address select
RXADDRESSES	0xE40		Receive address select
CRCCNF	0xE44		CRC configuration
CRCPOLY	0xE48		CRC polynomial
CRCINIT	0xE4C		CRC initial value
DAB[n]	0xE50		Device address base segment n
DAP[n]	0xE70		Device address prefix n
DACNF	0xE90		Device address match configuration
BCC	0xE94		Bit counter compare
CTESTATUS	0xEA4		CTEInfo parsed from received packet
MHRMATCHCONF	0xEB4		Search pattern configuration
MHRMATCHMASK	0xEB8		Pattern mask
SFD	0xEBC		IEEE 802.15.4 start of frame delimiter
CTEINLINECONF	0xEC0		Configuration for CTE inline mode
PACKETPTR	0xED0		Packet pointer
CSTONES.MODE	0x1000		Selects the mode(s) that are activated on the start signal
CSTONES.NUMSAMPLES	0x1004		Number of input samples at 2MHz sample rate
CSTONES.NEXTFREQUENCY	0x1008		The value of FREQUENCY that will be used in the next step
CSTONES.FAEPEER	0x1014		FAEPEER (Frequency Actuation Error) of peer if known. Used during Mode 0 steps.
CSTONES.PHASESHIFT	0x1018		Parameter used in TPM, provided by software
CSTONES.NUMSAMPLESCOEFF	0x101C		Parameter used in TPM, provided by software
CSTONES.PCT16	0x1020		Mean magnitude and mean phase converted to IQ
CSTONES.MAGPHASEMEAN	0x1024		Mean magnitude and phase of the signal before it is converted to PCT16
CSTONES.IQRAWMEAN	0x1028		Mean of IQ values
CSTONES.MAGSTD	0x102C		Magnitude standard deviation approximation
CSTONES.FFOEST	0x1034		FFO estimate
CSTONES.DOWNSAMPLE	0x1038		Turn on/off down sample of input IQ-signals
CSTONES.FREQOFFSET	0x1044		Frequency offset estimate
RTT.CONFIG	0x1050		RTT Config.

Register	Offset	TZ	Description
RTT.SEGMENT01	0x1054		RTT segments 0 and 1
RTT.SEGMENT23	0x1058		RTT segments 2 and 3
RTT.SEGMENT45	0x105C		RTT segments 4 and 5
RTT.SEGMENT67	0x1060		RTT segments 6 and 7

8.17.14.56 EVENTS_SYNC

Address offset: 0x258

Initial sync detected

For MODE=leee802154_250Kbit: A possible preamble has been received. However, due to the sporadic reception of noise, this event can be falsely triggered.

For MODE=Ble_LR125Kbit, Ble_LR500Kbit: A possible preamble has been received. However, due to the sporadic reception of noise, this event can be falsely triggered.

For MODE=Nrf_1Mbit, Nrf_2Mbit, Ble_1Mbit, or Ble_2Mbit: A possible preamble and the first two bytes of the address field has been received. The event can be generated falsely also in this mode.

It is also possible that the event is not generated, or not generated before the ADDRESS event.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Publish configuration for event [SYNC](#)

For MODE=leee802154_250Kbit: A possible preamble has been received. However, due to the sporadic reception of noise, this event can be falsely triggered.

For MODE=Ble_LR125Kbit, Ble_LR500Kbit: A possible preamble has been received. However, due to the sporadic reception of noise, this event can be falsely triggered.

For MODE=Nrf_1Mbit, Nrf_2Mbit, Ble_1Mbit, or Ble_2Mbit: A possible preamble and the first two bytes of the address field has been received. The event can be generated falsely also in this mode.

It is also possible that the event is not generated, or not generated before the ADDRESS event.

8.17.14.124 SWITCHPATTERN

Address offset: 0xD28

GPIO patterns to be used for each antenna

Maximum 8 GPIOs can be controlled. To secure correct signal levels on the pins, the pins must be configured in the GPIO peripheral as described in Pin configuration.

If the total number of antenna slots is bigger than the number of patterns, we loop back to the pattern used after the reference pattern.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

CRC polynomial

Bit number								31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID								A A																															

ID	R/W	Field	Value ID	Value	Description
A	RW	CRCPOLY			CRC polynomial
Each term in the CRC polynomial is mapped to a bit in this register which index corresponds to the term's exponent. The least significant term/bit is hardwired internally to 1, and bit number 0 of the register content is ignored by the hardware. The following example is for an 8 bit CRC polynomial: $x^8 + x^7 + x^3 + x^2 + 1 = 1\ 1000\ 1101$.

8.18 SAADC — Successive approximation analog-to-digital converter

The SAADC peripheral is a differential successive approximation register (SAR) analog-to-digital converter (ADC).

The main features of SAADC are the following:

- Four accuracy modes
 - 10-bit mode with a maximum sample rate of 2 Msps
 - 12-bit mode with a sample rate of 125 ksps
 - 14-bit mode with a sample rate of 62.5 ksps
 - Oversampling mode with configurable sample rate
- 10-bit arithmetic resolution in single-ended mode, 11-bit arithmetic resolution in differential mode, and 12/14-bit resolution with oversampling
- Full bandwidth up to 1 MHz (Nyquist) for all inputs
- Multiple analog inputs
 - GPIO pins with analog function (input range 0 to VDD)
 - VDD (divided down to a valid range using the programmable gain stage)
- Up to eight configurable gain input channels
 - One input per single-ended channel and two inputs per differential channel
 - Scan mode can be configured with both single-ended inputs and differential inputs
 - Each channel can be configured to select analog inputs
- Sampling triggered by a TASK from software or a DPPI channel for full flexibility on sample frequency source from low-power 32.768 kHz RTC or more accurate 1/16 MHz timers
- One-shot conversion mode to sample a single channel
- Scan mode to sample a series of channels in sequence with configurable sample delay
- Support for direct sample transfer to RAM using EasyDMA
- Interrupts on single sample and full buffer events
- Samples stored as 16-bit two's complement values for differential and single-ended sampling
- Continuous sampling without the need of an external timer
- On-the-fly limit checking

8.18.1 Shared resources

The SAADC peripheral can coexist with COMP and other peripherals using one of **AIN[0..7]**, provided these are assigned to different pins.

It is not recommended to select the same analog input pin for both peripherals.

8.18.2 Overview

The SAADC peripheral supports up to eight external analog inputs. It can be operated in one-shot mode with sampling under software control, or continuous mode with a programmable sampling rate.

The analog inputs can be configured as eight single-ended inputs, four differential inputs, or a combination of these. Each channel can be configured to select the following:

- GPIO pins with names starting with **AIN** which have analog input function, see [Pin assignments](#) on page 1219. Input range is 0 V to VDD.
- **VDD** (divided down to a valid range using the programmable gain stage)
- **DVDD**
- **AVDD**

Channels can be sampled individually in one-shot or continuous sampling modes, or multiple channels can be sampled in sequence using scan mode. To improve noise performance, channels can be oversampled.

Oversampling can be done with either noise shaping or by accumulation and averaging.

Figure 113: Simplified ADC block diagram

Internally, the ADC is always a differential analog-to-digital converter. By default, it is configured with single-ended input in the register `CH[n].CONFIG` using the `MODE` field. In single-ended mode, the negative input will be shorted to ground internally.

In single-ended mode, the ADC internal ground is the same as the external ground that is used for measuring the reference voltage. Because of this, the ADC is sensitive to ground bounce on the PCB in single-ended mode. Differential measurement is recommended if this is of concern.

8.18.3 Digital output

ADC output depends on the settings in the registers [CH\[n\].CONFIG](#) and [RESOLUTION](#) registers as follows:

$$\text{RESULT} = [V(P) - V(N)] * \text{GAIN} / \text{REFERENCE} * 2^{(\text{RESOLUTION} - m)}$$

$V(P)$ = voltage at input P,

$V(N)$ = voltage at input N,

GAIN = the selected gain setting

m = the mode setting (use m=0 if [CONFIG.MODE=SE](#), or m=1 if [CONFIG.MODE=Diff](#))

REFERENCE = selected reference voltage

The result generated by the ADC will deviate from what is expected due to DC errors like offset, gain, differential non-linearity (DNL), and integral non-linearity (INL). See [Electrical specification](#) for details on these parameters. The result can also vary due to AC errors like non-linearities in the GAIN block, settling errors due to high source impedance and sampling jitter. For battery measurement, the DC errors are most noticeable.

The ADC has a wide selection of gains controlled in the GAIN field of the register [CH\[n\].CONFIG](#). If [CH\[n\].CONFIG.REFSEL=0](#), the input range of the ADC core is nominally ± 0.9 V differentially, and the input must be scaled accordingly with proper gain setting.

The ADC has a temperature dependent offset. If the ADC is to operate over a large temperature range, it is recommended to run [CALIBRATEOFFSET](#) at regular intervals. The [CALIBRATEDONE](#) event will be generated when the calibration has been completed. The [DONE](#) and [RESULTDONE](#) events will also be generated.

8.18.4 Analog inputs and channels

Up to eight analog input channels, [CH\[n\]](#)(n=0..7), can be configured.

See [Shared resources](#) on page 554 for shared input with comparators.

For the SAADC peripheral to operate in one-shot mode, any available channel can be enabled. If more than one [CH\[n\]](#) is configured, SAADC enters scan mode.

An analog input is selected as a positive converter input and enabled by setting register [CH\[n\].PSEL](#).

An analog input is selected as a negative converter input if register [CH\[n\].PSELN](#) is set. The register [CH\[n\].PSELN](#) will have no effect unless differential mode is enabled and [CH\[n\].PSEL](#) is set, see [MODE](#) field in register [CH\[n\].CONFIG](#).

Note: It is not recommended to use the same analog input pin for multiple analog peripheral functions. See [Shared resources](#) on page 554.

8.18.5 Operation modes

The SAADC input configuration supports several modes of sampling.

- One-shot, one channel
- One-shot, scan (one sample for each channel)
- Continuous, one channel
- Continuous, scan

Note: Scan mode and oversampling should not be combined without burst.

Perform the following steps to sample ADC. At least one channel must be enabled in the register [CH\[n\].CONFIG](#).

1. Enable ADC with register [ENABLE](#).

2. Start ADC using the [START](#) task.
3. Trigger the [SAMPLE](#) task to sample ADC.

ADC indicates a single ongoing conversion via the register [STATUS](#). Multiple conversions occur in the ADC during oversampling, noise shaping, scan mode, or continuous modes. As a result, the value in register [STATUS](#) will toggle at the end of each single conversion.

8.18.5.1 One-shot mode

One-shot mode is configured by enabling only one of the available channels defined in registers [CH\[n\].PSELP](#), [CH\[n\].PSELN](#), and [CH\[n\].CONFIG](#).

After receiving a [SAMPLE](#) task, ADC powers up and starts to sample the input voltage. The [CH\[n\].CONFIG.TACQ](#) controls the acquisition time.

The time it takes to perform the first sample is given by the following equation:

$$t_{PWRUP} + t_{ACQ} + t_{CONV}$$

t_{ACQ} = the acquisition time
 t_{CONV} = the conversion time
 t_{PWRUP} = the time it takes to power up ADC

If multiple samples are taken, some combinations of t_{ACQ} and t_{CONV} will allow ADC to pipeline sampling and conversion. When this happens, the actual sampling time is t_{CONV} .

A [DONE](#) event signals that one sample has been taken.

In this mode, the [RESULTDONE](#) event has the same meaning as [DONE](#) when no oversampling takes place. Both events may occur before the actual value has been transferred into RAM by EasyDMA. For more information, see [EasyDMA](#) on page 559.

8.18.5.2 Continuous mode

Continuous sampling is achieved by using the internal timer in the ADC, or triggering the [SAMPLE](#) task from one of the general purpose timers through the PPI system.

The sample rate must meet the following criteria, depending on how many channels are active:

$$t_{SAMPLE} > t_{ACQ} + t_{CONV}$$

SAADC will use pipelining to increase sampling speed when the following are true:

$t_{ACQ}=0$
 $t_{CONV}=0$

In this case, the time for the first sample to arrive is given by the following equation:

$$t_{SAMPLE}=t_{PWRUP} + t_{ACQ} + t_{CONV}$$

Subsequent samples are given by the following equation:

$$f_{SAMPLE}=1/(t_{CONV})$$

The register [SAMPLERATE](#) can be used as a local timer instead of triggering individual [SAMPLE](#) tasks. When [SAMPLERATE.MODE](#) is set to Timers, it is sufficient to trigger [SAMPLE](#) task only once in order to start the SAADC peripheral. Triggering the [STOP](#) task will stop sampling. The [SAMPLERATE.CC](#) field controls the sample rate.

A [DONE](#) event signals that one sample has been taken.

In this mode, the **RESULTDONE** event has the same meaning as **DONE** when no oversampling takes place. Both events may occur before the value has been transferred into RAM by EasyDMA.

8.18.5.3 Improving sampling accuracy

SAADC has multiple options to improve sample accuracy. Noise shaping modes provide the highest performance by enabling a delta-sigma configuration with analog filtering, oversampling, and digital filtering. Pure oversampling is also supported.

Noise shaping

Noise shaping is implemented using the ADC peripheral within a first-order delta-sigma loop. The output is decimated and subsequently filtered with FIR filters. The sampling rate is 1 Msps in noise shaping modes and high-resolution settings ($\text{RESOLUTION} \geq 12$) are recommended. Enable noise shaping by configuring the register **NOISESHAPE**. Depending on the selected mode, the input signal must be bandwidth limited. See [Electrical specification](#) parameters $f_{\text{BW,NS}}$ for details.

Noise shaping modes are configured using the register **NOISESHAPE**.

Mode	Description
0	Noise shaping is disabled.
NS1	Noise shaping and decimation by 8, giving a sample rate of 125 ksp/s.
NS2	Noise shaping and decimation by 32, giving a sample rate of 31.25 ksp/s. Recommended resolution setting is 14 bits.
NS3	Noise shaping with oversampling set by the register OVERSAMPLE .

Table 55: Noise shaping modes

Oversampling

Oversampling can improve the signal-to-noise ratio (SNR) by approximately $10\log(\text{OSR})$, where OSR is the oversampling ratio. Each oversampled result is the combination of the $2^{\text{OVERSAMPLE}}$ samples that have gone through an accumulate-and-average filter.

Oversampling and scanning can only be combined when burst mode is enabled. Without burst mode, oversampling and scanning will average across multiple input channels.

The register **OVERSAMPLE** controls the accumulator. The $2^{\text{OVERSAMPLE}}$ samples must be taken before the result is written to RAM. This can be achieved by either of the following:

- Use the built-in SAADC local timer and the register **SAMPLERATE** to perform sampling.
- Use the TIMER peripheral and DPPI to trigger the SAADC SAMPLE task to sample $2^{\text{OVERSAMPLE}}$ times at a fixed rate.
- Trigger the **SAMPLE** task $2^{\text{OVERSAMPLE}}$ times from software.
- Enable burst mode and trigger the **SAMPLE** task once.

Burst mode can be enabled to avoid manually triggering the **SAMPLE** task $2^{\text{OVERSAMPLE}}$ times. When burst is enabled, ADC automatically samples the input $2^{\text{OVERSAMPLE}}$ times consecutively, with an approximate timing of $(t_{\text{ACQ}} + t_{\text{CONV}}) \times 2^{\text{OVERSAMPLE}}$. Besides extending the conversion time, it behaves like one-shot mode.

A **DONE** event indicates that a single sample has been acquired, while a **RESULTDONE** event indicates that enough samples have been gathered to transfer an oversampled result to RAM.

Chopping

Chopping is a technique used to cancel offset voltages and other low frequency errors, and is enabled in the register **CH[n].CONFIG.CHOPPING**. When chopping is enabled, the input to ADC is alternately inverted (chopped) at the input mux, and a conversion is performed for each phase of chop. Chopping is combined with oversampling and ADC output is passed through the accumulate and average filter used in oversampling mode.

8.18.5.4 Scan mode

A channel is considered enabled if **CH[n].PSELP** is set. If more than one channel is enabled, SAADC enters scan mode.

In scan mode, one **SAMPLE** task will trigger one conversion per enabled channel. The time it takes to sample all channels is calculated by the following:

```
Total time < Sum(CH[x].tACQ+tCONV), x=0..enabled channels
```

A **DONE** event signals that one channel has been sampled.

In this mode, the **RESULTDONE** event is generated after each sample, once for each channel.

8.18.6 EasyDMA

After configuring **RESULT.PTR** and **RESULT.MAXCNT**, SAADC resources are started by triggering the **START** task. SAADC uses EasyDMA to store results in a Result buffer in RAM.

The Result buffer is located at the address specified in the **RESULT.PTR** register. The **RESULT.PTR** register is double-buffered and can be updated and prepared for the next **START** task immediately after the **STARTED** event is generated. The size of the Result buffer (in bytes) is specified in the **RESULT.MAXCNT** register, and SAADC will generate an **END** event when the Result buffer is full, see **SAADC** on page 560. Results are stored in little-endian byte order in Data RAM. Every sample will be sign extended to 16 bits before stored in the Result buffer.

SAADC is stopped by triggering the **STOP** task. The **STOP** task will terminate an ongoing sampling. SAADC will generate a **STOPPED** event when it has stopped. If SAADC has already stopped when the **STOP** task is triggered, the **STOPPED** event is still generated.

Figure 114: SAADC

If the RESULT.PTR is not pointing to a RAM region accessible from the peripheral, an EasyDMA transfer may result in a HardFault, memory corruption, or both. See [Memory](#) on page 13 for more information about the memory regions.

The EasyDMA will have finished accessing the RAM when the END or STOPPED event has been generated.

The RESULT.AMOUNT register can be read following an END event or a STOPPED event to see how many bytes have been transferred to the Result buffer in RAM from when the START task was triggered.

In scan mode, SAMPLE tasks can be triggered once the START task is triggered. The END event is generated when the number of samples transferred to memory reaches the value specified by RESULT.MAXCNT. After an END event, the START task needs to be triggered again before new samples can be taken. For more information about the scan mode, see [Scan mode](#) on page 559.

Note: Ensure the Result buffer can hold at least one result for each enabled channel by setting [RESULT.MAXCNT](#) $\geq 2 \times$ (number of enabled channels). Each sample requires two bytes. Insufficient space leads to undefined behavior.

8.18.7 Reference

SAADC can use different reference voltages (VREF), controlled in the REFSEL field of the register [CH\[n\].CONFIG](#).

The accepted VREF voltages are the following:

- Internal reference, VREF=0.9 V
- External reference, VREF provided by the EXTREF pin

Note: The external reference voltage should be close ($\pm 5\%$) to the internal reference voltage VREF. Using a lower reference voltage will lead to increased leakage and can lead to undefined behavior.

ADC is preceded by a gain stage which has a programmable gain. The voltage range seen at the input of the gain stage is the following:

$$V_{\text{RangeDifferential}} = \pm V_{\text{REF}} / \text{GAIN}$$

$$V_{\text{RangeSingleEnded}} = \pm 0.5 * V_{\text{REF}} / \text{GAIN}$$

The **AIN[0 . . 7]** inputs cannot exceed VDD, or be lower than VSS. The input ranges are also limited by the REFERENCE and GAIN used.

The following condition must always hold true for valid measurements, otherwise the ADC will saturate and report the max value determined by the **RESOLUTION**.

$$[V(P) - V(N)] * \text{GAIN} / \text{REFERENCE} \leq 1$$

8.18.8 Acquisition time

To sample the input voltage, the SAADC peripheral connects a capacitor to the input.

The acquisition time indicates how long the capacitor is connected, see the TACQ field in the register **CH[n].CONFIG**. The required acquisition time depends on the source (R_{source}) resistance. For high source resistance, the acquisition time should be increased, see [Acquisition time](#) on page 561.

Figure 115: Simplified SAADC sample network

TACQ	Maximum source resistance [kΩ]
≤1	<1
3	10
5	40
10	100
15	200
20	400
40	800

Table 56: Acquisition time

8.18.9 Limits event monitoring

Monitoring a channel with an event can be set up by configuring limit register `CH[n].LIMIT`.

If the conversion result is higher than the defined high limit, or lower than the defined low limit, the appropriate event will be generated. Limit comparison happens automatically and does not need to be enabled.

Figure 116: Example of limits monitoring on channel [n]

When setting the channel limits, `CH[n].LIMIT.HIGH` must be higher than, or equal to, `CH[n].LIMIT.LOW`. In other words, an event can only be generated when the input signal has been sampled outside of the defined limits. It is not possible to generate an event when the input signal is inside a defined range by switching high and low limits.

If a channel does not require comparison, software ignores the related events. In that situation, the value of the limits registers is irrelevant, so it does not matter if `CH[n].LIMIT.LOW` is lower than `CH[n].LIMIT.HIGH` or not.

8.18.10 Performance factors

Clock jitter can affect sample timing accuracy and circuit noise can affect ADC performance.

Jitter can be between `START` tasks or from `START` task to acquisition. `START` timer accuracy and regulator start up times and references will contribute to variability. Sources of circuit noise may include CPU activity and the DC/DC regulator. Best ADC performance is achieved using `START` timing based on the `TIMER` module, `HFXO` clock source, and Constant Latency mode.

8.18.11 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
SAADC : S	GLOBAL	0x500D5000	US	S	SA	No	Successive approximation analog-to-digital converter SAADC
SAADC : NS		0x400D5000					

Configuration

Instance	Domain	Configuration
SAADC : S	GLOBAL	CURRENTAMOUNT register included.
SAADC : NS		

Register overview

Register	Offset	TZ	Description
TASKS_START	0x000		Start the ADC and prepare the result buffer in RAM
TASKS_SAMPLE	0x004		Take one ADC sample, if scan is enabled all channels are sampled. This task requires that SAADC has started, i.e. EVENTS_STARTED was set and EVENTS_STOPPED was not.
TASKS_STOP	0x008		Stop the ADC and terminate any on-going conversion
TASKS_CALIBRATEOFFSET	0x00C		Starts offset auto-calibration
SUBSCRIBE_START	0x080		Subscribe configuration for task START
SUBSCRIBE_SAMPLE	0x084		Subscribe configuration for task SAMPLE
SUBSCRIBE_STOP	0x088		Subscribe configuration for task STOP
SUBSCRIBE_CALIBRATEOFFSET	0x08C		Subscribe configuration for task CALIBRATEOFFSET
EVENTS_STARTED	0x100		The ADC DMA has started
EVENTS_END	0x104		The ADC has filled up the Result buffer
EVENTS_DONE	0x108		A conversion task has been completed. Depending on the mode, multiple conversions might be needed for a result to be transferred to RAM.
EVENTS_RESULTDONE	0x10C		A result is ready to get transferred to RAM.
EVENTS_CALIBRATEDONE	0x110		Calibration is complete
EVENTS_STOPPED	0x114		The ADC DMA has stopped
EVENTS_CH[n].LIMITH	0x118		Last results is above CH[n].LIMIT.HIGH
EVENTS_CH[n].LIMITL	0x11C		Last results is below CH[n].LIMIT.LOW
PUBLISH_STARTED	0x180		Publish configuration for event STARTED
PUBLISH_END	0x184		Publish configuration for event END
PUBLISH_DONE	0x188		Publish configuration for event DONE
PUBLISH_RESULTDONE	0x18C		Publish configuration for event RESULTDONE
PUBLISH_CALIBRATEDONE	0x190		Publish configuration for event CALIBRATEDONE
PUBLISH_STOPPED	0x194		Publish configuration for event STOPPED
PUBLISH_CH[n].LIMITH	0x198		Publish configuration for event CH[n].LIMITH
PUBLISH_CH[n].LIMITL	0x19C		Publish configuration for event CH[n].LIMITL
SHORTS	0x200		Shortcuts between local events and tasks
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
STATUS	0x400		Status
TRIM.LINCALCOEFF[n]	0x440		Linearity calibration coefficient
ENABLE	0x500		Enable or disable ADC

Register	Offset	TZ	Description
CH[n].PSELP	0x510		Input positive pin selection for CH[n]
CH[n].PSELN	0x514		Input negative pin selection for CH[n]
CH[n].CONFIG	0x518		Input configuration for CH[n]
CH[n].LIMIT	0x51C		High/low limits for event monitoring a channel
BURST	0x5E8		Enable burst mode
RESOLUTION	0x5F0		Resolution configuration
OVERSAMPLE	0x5F4		Oversampling configuration. OVERSAMPLE should not be combined with SCAN unless burst is enabled. The RESOLUTION is applied before averaging, thus for high OVERSAMPLE a higher RESOLUTION should be used.
SAMPLERATE	0x5F8		Configures the sampling rate for either task-triggered or continuous operation using a local timer
RESULT.PTR	0x62C		Data pointer
RESULT.MAXCNT	0x630		Maximum number of buffer bytes to transfer. Note that one sample is two bytes.
RESULT.AMOUNT	0x634		Number of buffer bytes transferred since last START, updated after the END or STOPPED events
RESULT.CURRENTAMOUNT	0x638		Number of buffer bytes transferred since last START, continuously updated
NOISESHAPE	0x654		SAADC provides two operational noise shaping modes (one that prioritizes higher bandwidth, while the other prioritizes higher accuracy) that allow trade-offs between ADC resolution, power consumption, and signal bandwidth.

8.18.11.1 TASKS_START

Address offset: 0x000

Start the ADC and prepare the result buffer in RAM

Bit number					31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

			Disable	0	Disable noiseshaping. Configurable oversampling.																													
			NS1	1	Noises shaping and decimating. Decimation ratio 8, maximum continuous output 125 kS/s, with resulting bandwidth at 40 kHz. Recommended resolution setting is 12 bits or higher. Takes precedence over the OVERSAMPLING register.																													
			NS2	2	Noises shaping and decimating. Decimation ratio 16, maximum continuous output 62.5 kS/s, with resulting bandwidth at 20 kHz. Recommended resolution setting is 14 bits. Takes precedence over the OVERSAMPLING register.																													
			NS3	3	Noise shaping with oversampling set by the OVERSAMPLE register. Recommended resolution setting is 14 bits.																													
			Audio	1	Use enumerator NS1 for future compatibility.																													
					This enumerator is deprecated.																													
			Accuracy	2	Use enumerator NS2 for future compatibility.																													
					This enumerator is deprecated.																													

8.19 SPIM — Serial peripheral interface controller with EasyDMA

The SPI controller peripheral (SPIM) with EasyDMA provides a full duplex, 4-wire synchronous serial communication interface.

The main features of SPIM are the following:

- EasyDMA direct transfer to and from RAM
- SPI mode [0..3]
- Individual selection of I/O pins
- Optional D/CX output line for distinguishing between command and data bytes
- Optional hardware controlled chip select (CSN)

Figure 117: SPIM with EasyDMA

8.19.1 SPIM transaction sequence

An SPIM transaction is started by triggering the START task. This initiates a number of bytes to be transmitted/received on SDO/SDI.

The following figure illustrates an SPIM transaction.

Figure 118: SPIM transaction

The ENDTX event is generated when all bytes in buffer [DMA.TX.PTR](#) on page 610 are transmitted. The number of bytes in the transmit buffer is specified in register [DMA.TX.MAXCNT](#) on page 610. The ENDRX event is generated when buffer [DMA.RX.PTR](#) on page 607 is full; that is when the number of bytes specified in register [DMA.RX.MAXCNT](#) on page 608 have been received. The transaction stops automatically after all bytes are transmitted or received. When the maximum number of bytes in the receive buffer is larger than the number of bytes in the transmit buffer, the contents of register [ORC](#) on page 606 will be transmitted after the last byte in the transmit buffer has been transmitted.

The END event is generated after both the ENDRX and ENDTX events have been generated.

SPIM is stopped by triggering the STOP task. If the STOP task is triggered during an ongoing transaction, SPIM completes the process for the current byte before stopping, and a STOPPED event is generated. The STOPPED event is only generated when the SPIM has an ongoing transaction at the time the STOP task is triggered.

If the ENDTX event has not been generated when the SPIM peripheral stops, the ENDTX event will be generated, even if all bytes in the buffer have not been transmitted.

If the ENDRX event has not been generated when the SPIM stops, the ENDRX event will be generated even if the buffer [DMA.RX.PTR](#) on page 607 is not full.

A transaction can be suspended and resumed using the SUSPEND and RESUME tasks, respectively. When the SUSPEND task is triggered, SPIM completes transmitting and receiving the current byte before it is suspended.

8.19.2 D/CX functionality

Some SPI targets, such as display drivers, require an additional signal from the SPIM to distinguish between command and data bytes. This line is called D/CX.

SPIM supports additional signals such as a D/CX output line. The D/CX line is set low for transmitting command bytes and high for transmitting data bytes.

The D/CX pin number is selected using [PSEL.DCX](#) on page 607. The number of command bytes that precede the data bytes is configured using [DCXCNT](#) on page 605. Writing to [DCXCNT](#) on page 605 during an ongoing transmission is not allowed.

The following figure shows D/CX in use, where `SPIM.DCXCNT=1`.

Figure 119: D/CX example

8.19.3 Chip select hardware control

To use CSN hardware control, set register [PSEL.CSN](#) on page 607 according to the [Pin configuration](#) on page 586.

Hardware-controlled CSN is suited when there is a single slave on the bus. When multiple slaves are attached to the bus, CSN must be controlled using GPIO.

When enabled, CSN is asserted automatically after [TASKS_START](#) on page 591 is triggered, and deasserted after [EVENTS_END](#) on page 595. The value in register [IFTIMING.CSNDUR](#) on page 605 sets the time between the falling edge of CSN and the first SCK edge. The same delay is used between the last SCK edge and the rising edge of CSN at the end of a transfer. It is also used between two transfers as the

minimum CSN inactive time when the **END_START short** is enabled. The **IFTIMING.CSNDUR** is expressed in number of SPIM core clock periods.

The following figure shows a timing diagram with two SPI transmissions where the delay is controlled by **IFTIMING.CSNDUR** and is represented by t_{CSNDUR} .

Figure 120: CSNDUR example

The following figure shows the timing delay for the combinations of polarity and phase settings. The register **CSNPOL** on page 605 determines the active polarity of the signal.

Figure 121: Polarity settings timing delay

8.19.4 Pin configuration

To configure pins for SPIM use, see the corresponding **PSEL.n** registers.

The contents of registers **PSEL.SCK**, **PSEL.CSN**, **PSEL.DCX**, **PSEL.MOSI**, and **PSEL.MISO** are only used when SPIM is enabled, and retained while the device is in System ON mode. The **PSEL.n** registers can be configured only when SPIM is disabled in register **ENABLE** on page 603.

To ensure correct behavior, the pins used by SPIM must be configured in the GPIO peripheral as described in **GPIO configuration** on page 587 before SPIM is enabled.

Only one peripheral can be assigned to drive a GPIO pin at a time. If more than one peripheral is assigned to a GPIO pin, it could result in unpredictable behavior.

SPIM signal	SPIM pin	Direction	Output value
SCK	As specified in PSEL.SCK on page 606	Output	Same as CONFIG.CPOL
CSN	As specified in PSEL.CSN on page 607	Output	Same as CONFIG.CPOL
DCX	As specified in PSEL.DCX on page 607	Output	1
SDO	As specified in PSEL.MOSI on page 606	Output	0
SDI	As specified in PSEL.MISO on page 607	Input	Not applicable

Table 57: GPIO configuration

SPIM supports SPI modes [0..3]. The clock polarity (CPOL) and the clock phase (CPHA) are configured in register [CONFIG](#) on page 604.

Mode	Clock polarity (CPOL)	Clock phase (CPHA)
SPI_MODE0	0 (Active High)	0 (Leading)
SPI_MODE1	0 (Active High)	1 (Trailing)
SPI_MODE2	1 (Active Low)	0 (Leading)
SPI_MODE3	1 (Active Low)	1 (Trailing)

Table 58: SPI modes

8.19.5 Shared resources

The SPIM peripheral shares registers and other resources with peripherals that have the same ID as SPIM. Before SPIM can be configured and used, all peripherals that have the same ID as SPIM must be disabled.

Disabling a peripheral with the same ID as SPIM will not reset any shared SPIM registers. Configure all SPIM registers to ensure they operate correctly.

See the Instantiation table in [Instantiation](#) on page 232 for details on peripherals and their IDs.

8.19.6 EasyDMA

SPIM uses EasyDMA to fetch data to transmit from RAM or store received data in RAM.

SPIM implements the following EasyDMA channels.

Channel	Type	Register Cluster
TXD	READER	DMA.TX.PTR on page 610
RXD	WRITER	DMA.RX.PTR on page 607

Table 59: SPIM EasyDMA channels

The .PTR and .MAXCNT registers are double-buffered. After receiving the STARTED event, the registers can be written to before the next transmission.

SPIM automatically stops transmitting after TXD.MAXCNT bytes have been transmitted and RXD.MAXCNT bytes have been received. If RXD.MAXCNT is larger than TXD.MAXCNT, the remaining transmitted bytes

will contain the value defined in the ORC register. If TXD.MAXCNT is larger than RXD.MAXCNT, the additional received bytes will be discarded.

The RX.END and TX.END events indicate that EasyDMA has finished accessing buffers in RAM. Both RX and TX must be finished before the END event is generated.

If several AHB bus masters try to access the same AHB slave at the same time, AHB bus congestion can occur. In this case, the EasyDMA channel behavior will depend on the SPIM instance. Refer to [Instances](#) on page 588 for information about what behavior is expected in each instance.

See [EasyDMA](#) for more detailed information.

8.19.7 Low power

When the peripheral is not needed, stop and disable SPIM to ensure lowest possible power consumption.

If a transaction is ongoing, the software must trigger the STOP task and wait for the STOPPED event before disabling the peripheral through the ENABLE register. If no transaction is ongoing, the peripheral can be disabled directly without triggering the STOP task.

Register overview

Register	Offset	TZ	Description
TASKS_START	0x000		Start SPI transaction
TASKS_STOP	0x004		Stop SPI transaction

Register	Offset	TZ	Description
TASKS_SUSPEND	0x00C		Suspend SPI transaction
TASKS_RESUME	0x010		Resume SPI transaction
TASKS_DMA.RX.ENABLEMATCH[n]	0x030		Enables the MATCH[n] event by setting the ENABLE[n] bit in the CONFIG register.
TASKS_DMA.RX.DISABLEMATCH[n]	0x040		Disables the MATCH[n] event by clearing the ENABLE[n] bit in the CONFIG register.
SUBSCRIBE_START	0x080		Subscribe configuration for task START
SUBSCRIBE_STOP	0x084		Subscribe configuration for task STOP
SUBSCRIBE_SUSPEND	0x08C		Subscribe configuration for task SUSPEND
SUBSCRIBE_RESUME	0x090		Subscribe configuration for task RESUME
SUBSCRIBE_DMA.RX.ENABLEMATCH[n]	0x0B0		Subscribe configuration for task ENABLEMATCH[n]
SUBSCRIBE_DMA.RX.DISABLEMATCH[n]	0x0C0		Subscribe configuration for task DISABLEMATCH[n]
EVENTS_STARTED	0x100		SPI transaction has started
EVENTS_STOPPED	0x104		SPI transaction has stopped
EVENTS_END	0x108		End of RXD buffer and TXD buffer reached
EVENTS_DMA.RX.END	0x14C		Generated after EasyDMA has completed its operation.
EVENTS_DMA.RX.READY	0x150		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.RX.BUSERROR	0x154		An error occurred during the bus transfer.
EVENTS_DMA.RX.MATCH[n]	0x158		Pattern match is detected on the DMA data bus.
EVENTS_DMA.TX.END	0x168		Generated after EasyDMA has completed its operation.
EVENTS_DMA.TX.READY	0x16C		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.TX.BUSERROR	0x170		An error occurred during the bus transfer.
PUBLISH_STARTED	0x180		Publish configuration for event STARTED
PUBLISH_STOPPED	0x184		Publish configuration for event STOPPED
PUBLISH_END	0x188		Publish configuration for event END
PUBLISH_DMA.RX.END	0x1CC		Publish configuration for event END
PUBLISH_DMA.RX.READY	0x1D0		Publish configuration for event READY
PUBLISH_DMA.RX.BUSERROR	0x1D4		Publish configuration for event BUSERROR
PUBLISH_DMA.RX.MATCH[n]	0x1D8		Publish configuration for event MATCH[n]
PUBLISH_DMA.TX.END	0x1E8		Publish configuration for event END
PUBLISH_DMA.TX.READY	0x1EC		Publish configuration for event READY
PUBLISH_DMA.TX.BUSERROR	0x1F0		Publish configuration for event BUSERROR
SHORTS	0x200		Shortcuts between local events and tasks
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
ENABLE	0x500		Enable SPIM
PRESCALER	0x52C		The prescaler is used to set the SPI frequency.
CONFIG	0x554		Configuration register
IFTIMING.RXDELAY	0x5AC		Sample delay for input serial data on SDI
IFTIMING.CSNDUR	0x5B0		Minimum duration between edge of CSN and edge of SCK. When SHORTS.END_START is used, this is also the minimum duration CSN must stay high between transactions.
DCXCNT	0x5B4		DCX configuration
CSNPOL	0x5B8		Polarity of CSN output
ORC	0x5C0		Byte transmitted after TXD.MAXCNT bytes have been transmitted in the case when RXD.MAXCNT is greater than TXD.MAXCNT
PSEL.SCK	0x600		Pin select for SCK
PSEL.MOSI	0x604		Pin select for SDO signal
PSEL.MISO	0x608		Pin select for SDI signal
PSEL.DCX	0x60C		Pin select for DCX signal
PSEL.CSN	0x610		Pin select for CSN
DMA.RX.PTR	0x704		RAM buffer start address
DMA.RX.MAXCNT	0x708		Maximum number of bytes in channel buffer

Register	Offset	TZ	Description
DMA.RX.AMOUNT	0x70C		Number of bytes transferred in the last transaction, updated after the END event. For channels that supports the compare match filter, this register is also updated after each MATCH event.
DMA.RX.LIST	0x714		EasyDMA list type
DMA.RX.TERMINATEONBUSERROR	0x71C		Terminate the transaction if a BUSERROR event is detected.
DMA.RX.BUSERRORADDRESS	0x720		Address of transaction that generated the last BUSERROR event.
DMA.RX.MATCH.CONFIG	0x724		Configure individual match events
DMA.RX.MATCH.CANDIDATE[n]	0x728		The data to look for - any match will trigger the MATCH[n] event, if enabled.
DMA.TX.PTR	0x73C		RAM buffer start address
DMA.TX.MAXCNT	0x740		Maximum number of bytes in channel buffer
DMA.TX.AMOUNT	0x744		Number of bytes transferred in the last transaction, updated after the END event. For channels that supports the compare match filter, this register is also updated after each MATCH event.
DMA.TX.LIST	0x74C		EasyDMA list type
DMA.TX.TERMINATEONBUSERROR	0x754		Terminate the transaction if a BUSERROR event is detected.
DMA.TX.BUSERRORADDRESS	0x758		Address of transaction that generated the last BUSERROR event.

A	RW	ENABLE			Enable or disable SPIM																														
			Disabled	0	Disable SPIM																														
			Enabled	7	Enable SPIM																														

8.19.8.23 PRESCALER

Address offset: 0x52C

The prescaler is used to set the SPI frequency.

The prescaler divides the core clock by the divisor to make the SPI clock. The resulting frequency is given by 'core clock' / DIVISOR. Different instances of the SPIM might have different core clocks. The SPIM core clock and divisor limits is given in the instance table in [Instances](#) on page 588.

Note that a low prescaler setting may require changing the default [RXDELAY](#) value to ensure correct sampling.

Only even numbers is allowed for the divisor.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

8.19.8.25 IFTIMING.RXDELAY

Address offset: 0x5AC

Sample delay for input serial data on SDI

If the value is written larger than the maximum value, the maximum value will be used.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A A																															
Reset 0x00000002				0 1 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW	RXDELAY		[7..0]	Sample delay for input serial data on SDI. The value specifies the number of SPIM core clock cycles delay from the the sampling edge of SCK (leading edge for CONFIG.CPHA = 0, trailing edge for CONFIG.CPHA = 1) until the input serial data is sampled. As an example, if RXDELAY = 0 and CONFIG.CPHA = 0, the input serial data is sampled on the rising edge of SCK.																														

8.19.8.26 IFTIMING.CSNDUR

Address offset: 0x5B0

Minimum duration between edge of CSN and edge of SCK. When SHORTS.END_START is used, this is also the minimum duration CSN must stay high between transactions.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A A A A A A A																															
Reset 0x00000002				0 1 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW	CSNDUR		[0xFF..0]	Minimum duration between edge of CSN and edge of SCK. When SHORTS.END_START is used, this is the minimum duration CSN must stay high between transactions. The value is specified in number of SPIM core clock cycles.																														
					Note that for low values of CSNDUR, the system turnaround time will dominate the actual time between transactions.

8.20 SPIS — Serial peripheral interface target with EasyDMA

The SPI target peripheral (SPIS) with EasyDMA provides a full duplex, 4-wire synchronous serial communication interface.

The main features of SPIS are the following:

- EasyDMA direct transfer to and from RAM
- SPI mode [0..3]
- Individual selection of I/O pins
- Hardware-based semaphore mechanisms for synchronizing access to data buffers by SPIS and CPU

Figure 122: SPIS

8.20.1 SPI modes

SPIS supports SPI modes [0..3]. Modes CPOL and CPHA are set in the CONFIG register.

Mode	Clock polarity (CPOL)	Clock phase (CPHA)
SPI_MODE0	0 (Active High)	0 (Sample on Leading)
SPI_MODE1	0 (Active High)	1 (Sample on Trailing)
SPI_MODE2	1 (Active Low)	0 (Sample on Leading)
SPI_MODE3	1 (Active Low)	1 (Sample on Trailing)

Table 60: SPI modes

8.20.2 Shared resources

The SPIS peripheral shares registers and other resources with peripherals that have the same ID as SPIS. Before SPIS can be configured and used, all peripherals that have the same ID as SPIS must be disabled.

Disabling a peripheral with the same ID as SPIS will not reset any shared SPIS registers. Configure all SPIS registers to ensure they operate correctly.

See the Instantiation table in [Instantiation](#) on page 232 for details on peripherals and their IDs.

8.20.3 EasyDMA

SPIS implements EasyDMA for accessing RAM without CPU involvement.

SPIS implements the EasyDMA channels found in the following table.

Channel	Type	Register Cluster
TXD	READER	TXD
RXD	WRITER	RXD

Table 61: SPIS EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 29.

If RXD.MAXCNT is greater than TXD.MAXCNT, the remaining transmitted bytes will contain the value defined in the ORC register.

The END event indicates that EasyDMA is finished accessing the RAM buffer.

8.20.4 SPIS operation

SPIS uses two memory pointers. RXD.PTR points to the RXD buffer (receive buffer) and TXD.PTR points to the TXD buffer (transmit buffer). Because these buffers are located in RAM, which can be accessed by both SPIS and the CPU, a hardware based semaphore mechanism is implemented to enable safe sharing.

The CPU must acquire the SPI semaphore before it can safely update the RXD.PTR and TXD.PTR pointers. The ACQUIRE task must be triggered for the CPU to receive the ACQUIRED event and have access to the semaphore. When the CPU has updated the RXD.PTR and TXD.PTR pointers, the CPU must release the semaphore before SPIS can acquire it.

The CPU releases the semaphore by triggering the RELEASE task, as illustrated in the following figure. Triggering the RELEASE task when the CPU does not have access to the semaphore will have no effect. See [Semaphore operation](#) on page 615 for more information.

Figure 123: SPI transaction when shortcut between END and ACQUIRE is enabled

If the CPU is not able to reconfigure TXD.PTR and RXD.PTR between granted transactions, the same TX data will be clocked out and the RX buffers will be overwritten. To prevent this from happening, the END_ACQUIRE shortcut can be used. With this shortcut enabled, the semaphore will be handed over to the CPU automatically after the granted transaction has completed. This enables the CPU to update the TXPTR and RXPTR between every granted transaction.

The ENDRX event is generated when the RX buffer has been filled.

The RXD.MAXCNT register specifies the maximum number of bytes SPIS can receive in one granted transaction. If SPIS receives more than RXD.MAXCNT number of bytes, an OVERFLOW will be indicated in the STATUS register and the incoming bytes will be discarded.

The TXD.MAXCNT parameter specifies the maximum number of bytes SPIS can transmit in one granted transaction. If SPIS is forced to transmit more than TXD.MAXCNT number of bytes, an OVERREAD will be indicated in the STATUS register and the ORC character will be clocked out.

The RXD.AMOUNT and TXD.AMOUNT registers are updated when a granted transaction is complete. The TXD.AMOUNT register indicates how many bytes were read from the TX buffer in the last transaction. ORC (over-read) characters are not included in this number. Similarly, the RXD.AMOUNT register indicates how many bytes were written into the RX buffer in the last transaction.

8.20.5 Semaphore operation

The semaphore is a mechanism implemented inside the SPIS peripheral that prevents SPIS and CPU from accessing data buffers simultaneously.

By default, the semaphore is assigned to the CPU after the SPIS peripheral is enabled. An ACQUIRED event will not be generated for this initial semaphore handover. If the ACQUIRE task is triggered while the semaphore is assigned to the CPU, an ACQUIRED event will be generated immediately. The following figure illustrates the transitions between states in the semaphore based on the relevant tasks and events.

Figure 124: SPI semaphore FSM

Note: The semaphore mechanism does not prevent the CPU from performing read or write access to the RXD.PTR register, TXD.PTR registers, or RAM that these pointers are pointing to. The semaphore is only telling when these can be updated by the CPU so that safe sharing is achieved.

SPIS will try to acquire the semaphore when the STARTED event is detected. If SPIS does not obtain the semaphore, the transaction will be ignored and the semaphore is retained by the CPU. All incoming data on SDI will be discarded and the DEF (default) character will be clocked out on the SDO line throughout the transaction. This is also true if the semaphore is released by the CPU during the transaction. If a race condition occurs where the CPU and SPIS try to acquire the semaphore at the same time, as illustrated in lifeline item 2 in figure [SPI transaction when shortcut between END and ACQUIRE is enabled](#) on page 614, the CPU is given the semaphore.

If SPIS acquires the semaphore, the transaction will be granted. The incoming data on SDI will be stored in the RXD buffer and the data in the TXD buffer will be clocked out on SDO.

When a transaction is complete and CSN goes HIGH, SPIS will automatically release the semaphore and generate the END event.

SPIS can be granted multiple transactions in a row as long as the semaphore is available.

If the CPU tries to acquire the semaphore while it is assigned to SPIS, an immediate handover will not be granted. After the granted transaction is complete, SPIS releases the semaphore to the CPU. If the `END_ACQUIRE` shortcut is enabled and the CPU has triggered the `ACQUIRE` task during a granted transaction, only one `ACQUIRE` request will be served following the `END` event.

8.20.6 Pin configuration

The CSN, SCK, SDI, and SDO signals associated with SPIS are mapped to physical pins according to the configuration specified in the `PSEL.CSN`, `PSEL.SCK`, `PSEL.MOSI`, and `PSEL.MISO` registers, respectively. If the `CONNECT` field is set to `Disconnected`, the associated SPIS signal will not be connected to any physical pins.

These registers and their configurations are only used when SPIS is enabled, and retained as long as the device is in System ON mode. See [POWER — Power control](#) on page 100 for more information about power modes. When the peripheral is disabled, the pins behave as regular GPIOs, and use the configuration in their respective `OUT` bit field and `PIN_CNF[n]` register. Only configure `PSEL.CSN`, `PSEL.SCK`, `PSEL.MOSI`, and `PSEL.MISO` when SPIS is disabled.

Before enabling SPIS, the pins used by SPIS must be configured in the GPIO peripheral as described in [GPIO configuration before enabling peripheral](#) on page 616. This ensures that the pins are driven correctly if SPIS becomes temporarily disabled, or if the device enters System OFF mode. This configuration must be retained in the GPIO for the selected pins to be recognized by an external SPI controller.

The SDO line is set as an input, with input buffer connected, as long as SPIS is not selected with CSN. This can cause additional current consumption if the SDO line is left floating. To avoid this, it is recommended to connect a pull-up or pull-down resistor on the SDO line when it is not driven by an external SPI controller.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

SPI signal	SPI pin	Direction	Output value	Comment
CSN	As specified in <code>PSEL.CSN</code>	Input	Not applicable	
SCK	As specified in <code>PSEL.SCK</code>	Input	Not applicable	
SDI	As specified in <code>PSEL.MOSI</code>	Input	Not applicable	
SDO	As specified in <code>PSEL.MISO</code>	Input	Not applicable	Emulates that SPIS is not selected.

Register overview

Register	Offset	TZ	Description
TASKS_ACQUIRE	0x014		Acquire SPI semaphore
TASKS_RELEASE	0x018		Release SPI semaphore, enabling the SPI slave to acquire it
TASKS_DMA.RX.ENABLEMATCH[n]	0x030		Enables the MATCH[n] event by setting the ENABLE[n] bit in the CONFIG register.
TASKS_DMA.RX.DISABLEMATCH[n]	0x040		Disables the MATCH[n] event by clearing the ENABLE[n] bit in the CONFIG register.
SUBSCRIBE_ACQUIRE	0x094		Subscribe configuration for task ACQUIRE
SUBSCRIBE_RELEASE	0x098		Subscribe configuration for task RELEASE
SUBSCRIBE_DMA.RX.ENABLEMATCH[n]	0x0B0		Subscribe configuration for task ENABLEMATCH[n]
SUBSCRIBE_DMA.RX.DISABLEMATCH[n]	0x0C0		Subscribe configuration for task DISABLEMATCH[n]
EVENTS_END	0x104		Granted transaction completed

Register	Offset	TZ	Description
EVENTS_ACQUIRED	0x118		Semaphore acquired
EVENTS_DMA.RX.END	0x14C		Generated after all MAXCNT bytes have been transferred
EVENTS_DMA.RX.READY	0x150		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.RX.BUSERROR	0x154		An error occurred during the bus transfer.
EVENTS_DMA.RX.MATCH[n]	0x158		Pattern match is detected on the DMA data bus.
EVENTS_DMA.TX.END	0x168		Generated after all MAXCNT bytes have been transferred
EVENTS_DMA.TX.READY	0x16C		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.TX.BUSERROR	0x170		An error occurred during the bus transfer.
PUBLISH_END	0x184		Publish configuration for event END
PUBLISH_ACQUIRED	0x198		Publish configuration for event ACQUIRED
PUBLISH_DMA.RX.END	0x1CC		Publish configuration for event END
PUBLISH_DMA.RX.READY	0x1D0		Publish configuration for event READY
PUBLISH_DMA.RX.BUSERROR	0x1D4		Publish configuration for event BUSERROR
PUBLISH_DMA.RX.MATCH[n]	0x1D8		Publish configuration for event MATCH[n]
PUBLISH_DMA.TX.END	0x1E8		Publish configuration for event END
PUBLISH_DMA.TX.READY	0x1EC		Publish configuration for event READY
PUBLISH_DMA.TX.BUSERROR	0x1F0		Publish configuration for event BUSERROR
SHORTS	0x200		Shortcuts between local events and tasks
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
SEMSTAT	0x400		Semaphore status register
STATUS	0x440		Status from last transaction
ENABLE	0x500		Enable SPI slave
CONFIG	0x554		Configuration register
DEF	0x55C		Default character. Character clocked out in case of an ignored transaction.
ORC	0x5C0		Over-read character
PSEL.SCK	0x600		Pin select for SCK
PSEL.MISO	0x604		Pin select for SDO signal
PSEL.MOSI	0x608		Pin select for SDI signal
PSEL.CSN	0x610		Pin select for CSN signal
DMA.RX.PTR	0x704		RAM buffer start address
DMA.RX.MAXCNT	0x708		Maximum number of bytes in channel buffer
DMA.RX.AMOUNT	0x70C		Number of bytes transferred in the last transaction, updated after the END event. Also updated after each MATCH event.
DMA.RX.LIST	0x714		EasyDMA list type
DMA.RX.TERMINATEONBUSERROR	0x71C		Terminate the transaction if a BUSERROR event is detected.
DMA.RX.BUSERRORADDRESS	0x720		Address of transaction that generated the last BUSERROR event.
DMA.RX.MATCH.CONFIG	0x724		Configure individual match events
DMA.RX.MATCH.CANDIDATE[n]	0x728		The data to look for - any match will trigger the MATCH[n] event, if enabled.
DMA.TX.PTR	0x73C		RAM buffer start address
DMA.TX.MAXCNT	0x740		Maximum number of bytes in channel buffer
DMA.TX.AMOUNT	0x744		Number of bytes transferred in the last transaction, updated after the END event. Also updated after each MATCH event.
DMA.TX.LIST	0x74C		EasyDMA list type
DMA.TX.TERMINATEONBUSERROR	0x754		Terminate the transaction if a BUSERROR event is detected.
DMA.TX.BUSERRORADDRESS	0x758		Address of transaction that generated the last BUSERROR event.

8.20.7.1 TASKS_ACQUIRE

Address offset: 0x014

Acquire SPI semaphore

8.21 TDM — Time division multiplexed audio interface

The time division multiplexed peripheral (TDM) is a multi-channel time division multiplexed audio interface that supports transferring up to eight channels within a sample frame. TDM can also be configured to support I²S in mono or stereo. It implements EasyDMA for sample transfer directly to and from RAM without CPU intervention.

The main features of TDM are the following:

- Controller and target clock mode
- Simultaneous bidirectional (TX and RX) audio streaming
- Up to eight output and input channels, in either left-aligned or right-aligned formats
- Supports mono or stereo I²S
- 8, 16, 24, and 32-bit sample widths
- Separate sample and word widths
- Serial clock (SCK) generator supporting a wide range of sample rates
- Separate controller clock (MCK) generator

Figure 125: Block diagram

8.21.1 Overview

The TDM interface is comprised of a frame synchronization pulse (FSYNC), a serial clock (SCLK), and the serial audio data (SDIN or SDOUT).

The Master always supplies the clock signals FSYNC and SCLK to the Slave. Serial data can be received on the input data pin **SDIN**, or transmitted on the output data pin **SDOUT**.

Figure 126: TDM overview

8.21.2 Transmitting and receiving

TDM supports both transmission (TX) and reception (RX) of serial data. In both cases the serial data is shifted synchronously to the SCK clock signal.

TX data is written to the SDOUT pin on the falling edge of SCK, and RX data is read from the SDIN pin on the rising edge of SCK. To change the active edge of SCK, use register [CONFIG.SCK.POLARITY](#) on page 663.

The most significant bit (MSB) is always transmitted first.

TX and RX are available in both Master and Slave modes and can be enabled/disabled independently in [CONFIG.RXTXEN](#) on page 661.

Transmission and/or reception is started by triggering the [START](#) task. When transmission is enabled in [CONFIG.TXEN](#), the [TXPTRUPD](#) event will be generated for every number of transmitted data words given by [TXD.MAXCNT](#) on page 670. Each data word contains one or more samples. The [TXPTRUPD](#) event is generated just before [MAXCNT](#) number of bytes have been transmitted. Similarly, when reception is enabled in [CONFIG.RXTXEN](#), the [RXPTRUPD](#) event is generated just after [MAXCNT](#) number of bytes have been received.

The [CONFIG.ORS](#) register stores extra samples used to align frames.

- When transmitting and receiving, if the receive size ([RXD.MAXCNT](#)) exceeds the transmit size ([TXD.MAXCNT](#)), additional bytes are sent after [TXD.MAXCNT](#) bytes have been transmitted. These extra bytes are being sent while [RXD.MAXCNT](#) bytes are received and continue until the frame is completed.
- When only transmitting, extra samples are sent after [TXD.MAXCNT](#) bytes have been transmitted to complete the frame.

If transmitting more samples than receiving ([TXD.MAXCNT](#) is larger than [RXD.MAXCNT](#)), the additional received samples will be discarded.

During receive-only operation, once [RXD.MAXCNT](#) bytes have been received, any further samples are discarded.

[CONFIG.ORS](#) follows the layout of a 32-bit memory word and can contain four 8-bit samples, two 16-bit samples, one right-aligned 24-bit sample sign-extended to 32 bit, or one 32-bit sample. The size of the samples is dependent on [CONFIG.SWIDTH](#). For details on the memory word layout, see [Channel mask and EasyDMA](#) on page 643.

The [MAXCNT](#) event is generated synchronously to the active FSYNC edge at the beginning of a frame after transmitting [RXD.MAXCNT](#) bytes. The initial [MAXCNT](#) event is generated at the first active edge of FSYNC after the [START](#) task has been triggered. The [MAXCNT](#) event is generated once all data has been transmitted and/or received. The data will be available in RAM upon completion of the EasyDMA operation.

Transmission can be aborted by using the [ABORT](#) task. This will abort TDM transfer possibly without completing [MAXCNT](#) words, and will cause the [ABORTED](#) event to be generated.

The following figure shows an example of transmitting and receiving aligned data using the following TDM configuration.

- [CONFIG.FSYNC.DURATION](#) = Channel
- [CONFIG.FSYNC.CPOLARITY](#) = PosEdge
- [CONFIG.SWIDTH](#) = 8Bit
- [CONFIG.CHANNEL.NUM](#) = Tdm2Ch
- [CONFIG.CHANNEL.DELAY](#) = Delay0Ck
- [TXD.MAXCNT](#) = 1

Figure 127: Transmitting and receiving data

8.21.3 Clocks

In addition to the frame sync (FSYNC) pulse, TDM has two clock signals. The master clock MCK and the sample data bit clock SCK.

MCK and SCK are independent and can be configured individually.

The serial clock (SCK), often referred to as the serial bit clock, pulses once for each data bit being transferred on the serial data lines SDIN and SDOUT.

The polarity of SCK is configured in [CONFIG.SCK.POLARITY](#).

When operating in Master mode, SCK clock source and frequency and is configured in [CONFIG.SCK.SRC](#) and [CONFIG.SCK.DIV](#) respectively. For [CONFIG.SCK.DIV](#) value, see [Clock divider equations](#) on page 641.

When operating in Slave mode, SCK is an input signal provided by the external master.

The optional master clock (MCK) is independent from SCK and FSYNC.

The master clock generator is enabled/disabled using [CONFIG.MCK.EN](#) on page 661, and the generator is started or stopped by the [START](#) or [STOP](#) tasks respectively.

8.21.3.1 Frame synchronization pulse (FSYNC)

FSYNC defines the start of the frame in the serial bit streams sent and received on SDOUT and SDIN, respectively. It is often referred to as "word clock", "sample clock", "word select", "frame clock", or "left/right clock".

In master mode, FSYNC duration is configured in [CONFIG.FSYNC.DURATION](#) on page 666. The duration can either be one SCK period, or one channel. This is illustrated in the following figure.

Figure 128: Configuration of FSYNC duration in Master mode

Regardless of FSYNC duration, the frequency of FSYNC is equivalent to the audio sample rate.

If it is possible to configure the sample size to only use a fraction of a channel, see [Width and alignment](#) on page 641. Also in this configuration FSYNC duration is the channel width (not the audio sample size), as illustrated in the following figure.

Figure 129: FSYNC duration when sample size is less than channel width

The alignment of the frame with the active edge of FSYNC can be adjusted using the register [CONFIG.CHANNEL.DELAY](#) on page 665. This allows the data to be delayed one or more periods of the serial clock following the active edge of FSYNC, as illustrated in the following figure.

Figure 130: Configuration of delay

When TDM is configured for the I²S mode, each frame contains one left and right sample pair, with the left sample being transferred during the low half period of FSYNC followed by the right sample being transferred during the high half period of FSYNC. There is a single SCK clock pulse delay between FSYNC edge and the first bit of the sample.

With the Aligned format, each frame contains one left and right sample pair, with the left sample being transferred during the high half period of FSYNC followed by the right sample being transferred during the low half period of FSYNC. There is no delay between FSYNC edge and the first bit of the sample.

For TDM, the active edge of FSYNC defines the beginning of a frame. The words within the frame are transferred continuously, with no transitions of FSYNC.

FSYNC configuration details described above is summarised the following table.

Format	CONFIG.FSYNC.DURATION	CONFIG.FSYNC.POLARITY	CONFIG.CHANNEL.DELAY
I2S	Channel	Left=NegEdge	Delay1Ck
Aligned	Channel	Left=PosEdge	Delay0Ck
TDM	Channel or Sck	PosEdge	Delay0Ck, Delay1Ck, or Delay2Ck

Table 63: FSYNC configuration overview

8.21.3.2 Clock source selection

The clock source for SCK and MCK is selectable in registers [CONFIG.MCK.SRC](#) on page 662 and [CONFIG.SCK.SRC](#) on page 663 respectively.

The following clocks can be selected as the clock source.

- Peripheral clock (PCLK)
- Additional clock (ACLK)

To improve the clock accuracy and jitter performance, it is recommended (but not mandatory) that the PCLK source used is running off the external crystal. The ACLK source requires the use of a crystal. See [CLOCK — Clock control](#) on page 72 for more information about clock sources.

The clock generator can be bypassed so that MCK or SCK is derived directly from the input source. This can be configured in the BYPASS field of their respective registers [CONFIG.SCK.SRC](#) and [CONFIG.MCK.SRC](#).

8.21.3.3 Clock frequency selection

MCK and SCK frequency can be adjusted on-the-fly by using [CONFIG.MCK.DIV](#) or [CONFIG.SCK.DIV](#).

8.21.3.3.1 Clock divider equations

The following equations are used to select SCK and MCK frequencies.

In the following equations, the following notation is used:

- f_{CK} is the SCK or MCK frequency in Hz.
- f_{source} is the frequency of the selected clock source, either ACLK or PCLK.
- DIV is the [CONFIG.SCK.DIV](#) or [CONFIG.MCK.DIV](#) register value.

The first equation is used to calculate the value of [CONFIG.MCK.DIV](#) or [CONFIG.SCK.DIV](#) for a given source, and MCK or SCK frequency.

$$DIV = 4096 \cdot \left\lceil \frac{f_{CK} \cdot 1048576}{f_{source} + \frac{f_{CK}}{2}} \right\rceil$$

Figure 131: MCK and SCK clock frequency equation

Because of rounding errors, an accurate MCK clock may not be achievable. The equation does not take into account the maximum register values of [CONFIG.MCK.DIV](#) or [CONFIG.SCK.DIV](#).

The actual MCK or SCK frequency can be calculated using the equation below.

$$f_{actual} = \frac{f_{source}}{\left\lfloor \frac{1048576 \cdot 4096}{DIV} \right\rfloor}$$

Figure 132: Actual MCK and SCK clock frequency

The clock error can be calculated using the equation below. The error e is the percentage difference from the requested f_{MCK} or f_{SCK} frequency.

$$e = 100 \cdot \frac{f_{actual} - f_{CK}}{f_{CK}} = 100 \cdot \frac{\frac{f_{source}}{\left\lfloor \frac{1048576 \cdot 4096}{DIV} \right\rfloor} - f_{CK}}{f_{CK}}$$

Figure 133: MCK and SCK frequency error equation

8.21.4 Width and alignment

Each audio data sample is followed by sufficient number of zero data bits to complete an M-bit word. The [CONFIG.SWIDTH](#) on page 664 register defines the sample width of the data read and written to memory, as well as the number of SCK clock cycles per word. The M-bit word is sometimes referred to as a *channel block*.

The following figure illustrates a configuration with identical sample and channel/word widths. The number of SCK pulses matches the number of sample bits.

Figure 134: Aligned format, with [CONFIG.SWIDTH](#) configured to 16 bit samples in a 16 bit word

The next figure illustrates a configuration with greater word width than sample width. The number of SCK pulses are greater than the number of sample bits, with the sample being left-aligned in the word.

Figure 135: Aligned format, with [CONFIG.SWIDTH](#) configured to 16-bit samples in a 32-bit word

Alignment of samples

If the word width differs from the sample width, the sample value can be either right or left-aligned inside a word, as specified in [CONFIG.ALIGN](#) on page 664.

When using left-alignment, each word starts with the MSB of the sample value, as illustrated in the following figure.

Figure 136: [CONFIG.ALIGN](#) set to left justified

When using right-alignment, each word ends with the LSB of the sample value. This is illustrated in the following figure.

Figure 137: `CONFIG.ALIGN` set to right justified

8.21.5 Channel mask and EasyDMA

TDM implements EasyDMA for accessing RAM without CPU intervention.

EasyDMA

The source and destination pointers for the TX and RX data are configured in `TXD.PTR` on page 669 and `RXD.PTR` on page 668. The memory pointed to by these pointers will only be read or written when TX or RX are enabled in and .

The addresses written to the pointer registers `TXD.PTR` on page 669 and `RXD.PTR` on page 668 are double-buffered in hardware, and these double buffers are updated for every `TXD.MAXCNT`/`RXD.MAXCNT` words (containing one or more samples) read/written from/to memory. The events `TXPTRUPD` and `RXPTRUPD` are generated whenever the `TXD.PTR` and `RXD.PTR` are transferred to these double buffers.

If `TXD.PTR` on page 669 is not pointing to the Data RAM region when transmission is enabled, or `RXD.PTR` on page 668 is not pointing to the Data RAM region when reception is enabled, an EasyDMA transfer may result in a HardFault and/or memory corruption. See [Memory](#) on page 13 for more information about the different memory regions.

The size of the RXD and TXD memory buffers are independent, but the number of transmitted bytes always equals the number of received bytes. With `RXD.MAXCNT` and `TXD.MAXCNT` being independent, data is either discarded or padded as described in [Transmitting and receiving](#) on page 637. The size of the buffers is specified in a number of bytes, however the memory is organized in 32-bit words that either contain four 8-bit samples, two 16-bit samples, one right-aligned 24-bit sample sign extended to 32 bit, or one 32-bit sample.

Channel masking

Channel masking takes place between the transceiver and the EasyDMA access to memory as illustrated in the following figure.

Figure 138: Channel masking block diagram

Which of the samples transferred over the data lines are accessed by EasyDMA, is selected by the register `CONFIG.CHANNEL.MASK` on page 664. In this register, channels are enabled or disabled from the memory transfers. Disabled channels are ignored - transmitted bits are zero, and received data is discarded. Enabled channels will have their data stored to, or received from, memory.

Figure 139: Channel masking example. Four channel audio input, storing only two channels to memory

Memory map for single channel (mono)

When the resulting data after channel masking is a single channel, the following figures show how this channel's samples are mapped to memory. The mapping is valid for both RX and TX.

	31	24	23	16	15	8	7	0
x.PTR	Left sample 3		Left sample 2		Left sample 1		Left sample 0	
x.PTR + 4	Left sample 7		Left sample 6		Left sample 5		Left sample 4	
x.PTR + n - 4	Left sample n-1		Left sample n-2		Left sample n-3		Left sample n-4	

Figure 140: Memory mapping for 8 bit mono. `CONFIG.SWIDTH = 8Bit`, `CONFIG.CHANNEL.NUM = 2` and `CONFIG.CHANNEL.MASK = 0x00010001`

	31	16	15	0
x.PTR	Left sample 1		Left sample 0	
x.PTR + 4	Left sample 3		Left sample 2	
x.PTR + (n*2) - 4	Left sample n - 1		Left sample n - 2	

Figure 141: Memory mapping for 16 bit mono, left channel only. `CONFIG.SWIDTH = 16Bit`, `CONFIG.CHANNEL.NUM = 2` and `CONFIG.CHANNEL.MASK = 0x00010001`

Figure 142: Memory mapping for 24 bit mono, left channel only. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNEL.NUM = 2 and CONFIG.CHANNEL.MASK = 0x00010001

Figure 143: Memory mapping for 32 bit mono, left channel only. CONFIG.SWIDTH = 32Bit, CONFIG.CHANNEL.NUM = 2 and CONFIG.CHANNEL.MASK = 0x00010001

Memory map for two channels (stereo)

When the resulting data after channel masking is two channels (stereo), the following figures show how this channel's samples are mapped to memory. The mapping is valid for both RX and TX.

Figure 144: Memory mapping for 8 bit stereo. CONFIG.SWIDTH = 8Bit, CONFIG.CHANNEL.NUM = 2 and CONFIG.CHANNEL.MASK = 0x00030003

Figure 145: Memory mapping for 16 bit stereo. CONFIG.SWIDTH = 16Bit, CONFIG.CHANNEL.NUM = 2 and CONFIG.CHANNEL.MASK = 0x00030003

	31	23	0
x.PTR	Sign ext.	Left sample 0	
x.PTR + 4	Sign ext.	Right sample 0	
x.PTR + (n*8) - 8	Sign ext.	Left sample n - 1	
x.PTR + (n*8) - 4	Sign ext.	Right sample n - 1	

Figure 146: Memory mapping for 24 bit stereo. CONFIG.SWIDTH = 24Bit, CONFIG.CHANNEL.NUM = 2 and CONFIG.CHANNEL.MASK = 0x00030003

	31	0
x.PTR	Left sample 0	
x.PTR + 4	Right sample 0	
x.PTR + (n*8) - 8	Left sample n - 1	
x.PTR + (n*8) - 4	Right sample n - 1	

Figure 147: Memory mapping for 32 bit stereo. CONFIG.SWIDTH = 32Bit, CONFIG.CHANNEL.NUM = 2 and CONFIG.CHANNEL.MASK = 0x00030003

Memory map for multi-channel (three or more)

The following equation can be used to calculate the address of the word storing a multi-channel sample. The equation is valid for both RX and TX. The following notation is used.

- S is the number of data bits in a sample
- N total number of channels per sample
- n is the channel number of the current sample
- m is the sample number

$$x.PTR + \left\lfloor \frac{m \times N + n}{\left\lfloor \frac{32}{S} \right\rfloor} \right\rfloor \times 4$$

Figure 148: The equation for calculating the 32-bit aligned address of a multi-channel sample.

When the resulting data after channel masking is three or more the samples are stored sequentially in memory, similar to stereo. The following figures show how the samples are mapped to memory. The mapping is valid for both RX and TX.

Figure 149: Memory mapping for 8 bit TDM. CONFIG.SWIDTH = 8Bit,
CONFIG.CHANNEL.NUM = n and all channels enabled in CONFIG.CHANNEL.MASK

Figure 150: Memory mapping for 16 bit TDM. CONFIG.SWIDTH = 16Bit,
CONFIG.CHANNEL.NUM = n and all channels enabled in CONFIG.CHANNEL.MASK

Figure 151: Memory mapping for 24 bit TDM. *CONFIG.SWIDTH = 24Bit, CONFIG.CHANNEL.NUM = n and all channels enabled in CONFIG.CHANNEL.MASK*

Figure 152: Memory mapping for 32 bit TDM. *CONFIG.SWIDTH = 32Bit, CONFIG.CHANNEL.NUM = n and all channels enabled in CONFIG.CHANNEL.MASK*

8.21.6 Pin configuration

The MCK, SCK, FSYNC, SDIN and SDOUT signals associated with TDM are mapped to physical pins according to the pin numbers specified in the PSEL.x registers.

These pins are acquired whenever TDM is enabled through the register [ENABLE](#) on page 660.

When a pin is acquired by TDM, the direction of the pin (input or output) will be configured automatically, and any pin direction setting done in the GPIO module will be overridden. The directions for the various TDM pins are shown in the following tables.

To secure correct signal levels on the pins in System OFF mode, and when TDM is disabled, these pins must be configured in the GPIO peripheral directly.

TDM signal	TDM pin	Direction	Output value	Comment
MCK	As specified in PSEL.MCK	Output	0	
FSYNC	As specified in PSEL.FSYNC	Output	0	
SCK	As specified in PSEL.SCK	Output	0	
SDIN	As specified in PSEL.SDIN	Input	Not applicable	
SDOUT	As specified in PSEL.SDOUT	Output	0	

Table 64: GPIO configuration before enabling peripheral (Master mode)

TDM signal	TDM pin	Direction	Output value	Comment
MCK	As specified in PSEL.MCK	Output	0	
FSYNC	As specified in PSEL.FSYNC	Input	Not applicable	
SCK	As specified in PSEL.SCK	Input	Not applicable	
SDIN	As specified in PSEL.SDIN	Input	Not applicable	
SDOUT	As specified in PSEL.SDOUT	Output	0	

Table 65: GPIO configuration before enabling peripheral (Slave mode)

8.21.7 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
TDM : S	GLOBAL	0x500E8000	US	S	SA	No	Time division multiplexed audio interface TDM
TDM : NS		0x400E8000					

Configuration

Instance	Domain	Configuration
		Use GPIO port P1 or P3
TDM : S	GLOBAL	ACLK is the fixed 24 MHz clock PCLK24M
TDM : NS		PCLK is the fixed 32 MHz clock PCLK32M
		CURRENTAMOUNT register included.

Register overview

Register	Offset	TZ	Description
TASKS_START	0x000		Starts continuous TDM transfer. Also starts MCK when this is enabled
TASKS_STOP	0x004		Stops TDM transfer after the completion of MAXCNT bytes. Triggering this task will cause the STOPPED event to be generated.
TASKS_ABORT	0x008		Abort TDM transfer without completing MAXCNT bytes. Triggering this task will cause the ABORTED event to be generated.

Register	Offset	TZ	Description
SUBSCRIBE_START	0x080		Subscribe configuration for task START
SUBSCRIBE_STOP	0x084		Subscribe configuration for task STOP
SUBSCRIBE_ABORT	0x088		Subscribe configuration for task ABORT
EVENTS_RXPTRUPD	0x104		The RXD.PTR register has been copied to internal double-buffers. When TDM is started and RX is enabled, this event will be generated for every RXTXD.MAXCNT bytes received on the SDIN pin.
EVENTS_STOPPED	0x108		Transfer stopped.
EVENTS_ABORTED	0x10C		Transfer aborted.
EVENTS_TXPTRUPD	0x118		The TDX.PTR register has been copied to internal double-buffers. When TDM is started and TX is enabled, this event will be generated for every RXTXD.MAXCNT bytes that are sent on the SDOUT pin.
EVENTS_MAXCNT	0x120		Generated on the active edge of FSYNC, after both RX and TX DMA transfers have completed. An initial MAXCNT event is also triggered on the first active edge of FSYNC after the START task is issued.
EVENTS_BUSERROR_RX	0x124		This event is generated if an error occurs during the bus transfer.
EVENTS_BUSERROR_TX	0x128		This event is generated if an error occurs during the bus transfer.
PUBLISH_RXPTRUPD	0x184		Publish configuration for event RXPTRUPD
PUBLISH_STOPPED	0x188		Publish configuration for event STOPPED
PUBLISH_ABORTED	0x18C		Publish configuration for event ABORTED
PUBLISH_TXPTRUPD	0x198		Publish configuration for event TXPTRUPD
PUBLISH_MAXCNT	0x1A0		Publish configuration for event MAXCNT
PUBLISH_BUSERROR_RX	0x1A4		Publish configuration for event BUSERROR_RX
PUBLISH_BUSERROR_TX	0x1A8		Publish configuration for event BUSERROR_TX
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
ENABLE	0x500		Enable TDM
CONFIG.MODE	0x504		Mode configuration
CONFIG.RXTXEN	0x508		Reception (RX) and transmission (TX) enable.
CONFIG.MCK.EN	0x50C		Master clock generator enable.
CONFIG.MCK.DIV	0x510		MCK divider.
CONFIG.MCK.SRC	0x514		MCK clock source selection
CONFIG.SCK.DIV	0x518		SCK divider.
CONFIG.SCK.SRC	0x51C		SCK clock source selection
CONFIG.SCK.POLARITY	0x520		Set SCK Polarity.
CONFIG.SWIDTH	0x524		Sample and word width configuration.
CONFIG.ALIGN	0x528		Alignment of sample within the audio data word.
CONFIG.CHANNEL.MASK	0x52C		Select which channels are to be used.
CONFIG.CHANNEL.NUM	0x530		Select number of channels.
CONFIG.CHANNEL.DELAY	0x534		Set channel delay.
CONFIG.FSYNC.POLARITY	0x538		Set FSYNC Polarity.
CONFIG.FSYNC.DURATION	0x53C		Set FSYNC duration.
CONFIG.ORS	0x540		Over-read sample: Extra sample(s) to be transmitted after TXD.MAXCNT bytes have been transmitted.
PSEL.MCK	0x570		Pin select for MCK signal
PSEL.SCK	0x574		Pin select for SCK signal
PSEL.FSYNC	0x578		Pin select for FSYNC signal
PSEL.SDIN	0x57C		Pin select for SDIN signal
PSEL.SDOUT	0x580		Pin select for SDOUT signal
RXD.PTR	0x704		RAM buffer start address
RXD.MAXCNT	0x708		Maximum number of bytes in channel buffer
RXD.AMOUNT	0x70C		Number of bytes transferred in the last transaction, updated after the END event.

Register	Offset	TZ	Description
RXD.CURRENTAMOUNT	0x710		Number of bytes transferred in the current transaction
RXD.MODE	0x718		Configure EasyDMA mode
RXD.TERMINATEONBUSERROR	0x71C		Terminate the transaction if a BUSERROR event is detected.
RXD.BUSERRORADDRESS	0x720		Address of transaction that generated the last BUSERROR event.
TXD.PTR	0x744		RAM buffer start address
TXD.MAXCNT	0x748		Maximum number of bytes in channel buffer
TXD.AMOUNT	0x74C		Number of bytes transferred in the last transaction, updated after the END event.
TXD.CURRENTAMOUNT	0x750		Number of bytes transferred in the current transaction
TXD.MODE	0x758		Configure EasyDMA mode
TXD.TERMINATEONBUSERROR	0x75C		Terminate the transaction if a BUSERROR event is detected.
TXD.BUSERRORADDRESS	0x760		Address of transaction that generated the last BUSERROR event.

8.21.7.1 TASKS_START

Address offset: 0x000

Starts continuous TDM transfer. Also starts MCK when this is enabled

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

8.22 TEMP — Temperature sensor

The temperature sensor peripheral (TEMP) measures die temperature over the temperature range of the device. Linearity compensation can be implemented if required by the application.

The main features of TEMP are the following:

- Temperature range is greater than or equal to operating temperature of the device
- Resolution is 0.25 degrees
- TEMP analog electronics power down after temperature measurement is completed

To achieve the measurement accuracy stated in the electrical specification, the crystal oscillator must be selected as the HFCLK source, see [CLOCK — Clock control](#) on page 72 for more information.

8.22.1 Operation

TEMP is started by triggering the START task.

When the temperature measurement is finished, a DATARDY event will be generated and the measurement result can be read from the TEMP register.

When the temperature measurement is finished, TEMP analog electronics power-down to save power.

TEMP only supports one-shot operation, meaning that every TEMP measurement has to be explicitly started using the START task.

8.22.2 Registers

8.23 TIMER — Timer/counter

The TIMER peripheral is a general purpose timer allowing user defined time intervals.

The main features of TIMER are the following:

- Two modes of operation: Timer mode and Counter mode
- Multiple capture/compare registers
- Compare event for every capture/compare register
- 4-bit (1/2X) prescaler
- Configurable number of bits including 8, 16, 24 or 32 bits
- TIMER runs on the high-frequency clock source (HFCLK)

TIMER runs on the high-frequency clock source (HFCLK) and includes a four-bit (1/2X) prescaler that can divide the timer input clock (PCLK) from the HFCLK controller. The TIMER base frequency is always given as PCLK divided by the prescaler value.

The PPI system allows a TIMER event to trigger a task on another system peripheral on the device. The PPI system also enables the TIMER task/event feature to generate periodic output and PWM signals to any GPIO. The number of GPIO pins used at the same time is limited by the number of GPIOTE channels.

8.23.1 TIMER modes

TIMER can operate in two modes: Timer mode and Counter mode. In both modes, TIMER is started by triggering the START task, and stopped by triggering the STOP task. After TIMER stops, it can resume timing/counting by triggering the START task again. When timing/counting resumes, TIMER continues from the value it was on prior to stopping.

In Timer mode, TIMER's internal COUNTER register is incremented by one for every tick of the timer frequency f_{TIMER} , as shown in the following figure. The timer frequency is derived from PCLK as shown in the following example, using the values specified in the PRESCALER register.

$$f_{\text{TIMER}} = \text{PCLK} / (2^{\text{PRESCALER}})$$

Figure 153: Timer/counter operation

For timers using PCLK16M as PCLK, when $f_{\text{TIMER}} \leq 1$ MHz, TIMER uses PCLK1M instead of PCLK for reduced power consumption. Clock source selection between PCLK and PCLK1M is automatic according to the TIMER base frequency set by the prescaler.

In Counter mode, the TIMER's internal COUNTER register is incremented by one each time the COUNT task is triggered, meaning the timer frequency and the prescaler are not used in Counter mode. Similarly, the COUNT task has no effect in Timer mode.

The maximum value of TIMER is configured by changing the bit-width of the timer in register [BITMODE](#) on page 688.

[PRESCALER](#) on page 688 and [BITMODE](#) on page 688 must only be updated when TIMER is stopped. If these registers are updated while TIMER is started, unpredictable behavior may occur.

When TIMER is incremented beyond its maximum value, the Counter register will overflow and TIMER will automatically start over from zero.

The Counter register can be cleared by triggering the CLEAR task. This will explicitly set the internal value to zero.

TIMER implements multiple capture/compare registers.

Independent of prescaler settings, the accuracy of TIMER is equivalent to one tick of the timer frequency f_{TIMER} as shown in [Timer/counter operation](#) on page 680.

8.23.2 Capture

TIMER implements one capture task for every available capture/compare register.

Every time the CAPTURE[n] task is triggered, the counter value is copied to the CC[n] register.

8.23.3 Compare

TIMER implements one COMPARE event for every available capture/compare register.

When the counter value becomes equal to the value specified in a capture compare register CC[n], the corresponding compare event COMPARE[n] is generated.

[BITMODE](#) on page 688 specifies how many Counter and capture/compare register bits are used when the comparison is performed. Other bits are ignored.

The COMPARE event can be configured to operate in one-shot mode by configuring the corresponding ONESHOTEN[n] register. After writing CC[n], a COMPARE[n] event is generated the first time the Counter matches CC[n].

8.23.4 Task delays

After TIMER is started, the CLEAR, COUNT, and STOP tasks are guaranteed to take effect within one clock cycle of the PCLK.

8.23.5 Task priority

If the START task and the STOP task are triggered at the same time, meaning within the same period of PCLK, the STOP task is prioritized.

If one or more of the CAPTURE tasks and the CLEAR task are triggered at the same time, that is, within the same period of PCLK, the CAPTURE tasks are prioritized. This means that the CC registers will capture the counter value before the CLEAR tasks are triggered.

8.23.6 Registers

Instances

8.24 TWIM — I²C compatible two-wire interface controller with EasyDMA

The TWI controller peripheral (TWIM) with EasyDMA provides a half duplex, two-wire synchronous serial communication interface which supports multiple targets in the same bus.

The main features of TWIM are the following:

- I²C compatible for 100 kbps and 400 kbps
- 1000 kbps bit rate support for selected pull-up resistor/bus capacitance combinations
- Supported baud rates:
 - 100 kbps
 - 400 kbps
 - 1000 kbps
- EasyDMA direct transfer to and from RAM
- Individual selection of I/O pins
- Support for clock stretching
- Transmissions can be suspended and resumed

The two-wire interface can communicate with a bidirectional wired-AND bus with two lines (SCL, SDA). The interface enables interconnecting up to 127 individually addressable devices. TWIM is not compatible with CBUS.

Selecting GPIO pins individually ensures flexibility in device pinout and efficient use of board space and signal routing.

The diagram illustrates a TWIM peripheral connected to three TWI targets (EEPROM and two Sensors) via an I2C bus. The TWIM block has SDA and SCL pins. The first TWI target (EEPROM) has SCL and SDA pins and is connected to VDD. The second TWI target (Sensor) has SCL and SDA pins. The third TWI target (Sensor) has SCL and SDA pins. All SCL lines are connected to a common bus, and all SDA lines are connected to a common bus. The TWIM SDA and SCL pins are connected to these common buses.

TWIM supports clock stretching performed by the targets.

The **FREQUENCY** register defines the speed at which data is transmitted over the interface. Enumerators for common frequencies, such as `K100` or `K400`, are provided.

4539_001 v1.0

690

NORDIC™

 SEMICONDUCTOR

Note: The frequency calculation equation is applicable only within the following SCL frequency ranges:

- Fast-mode: 90 kHz to 500 kHz
- Fast-mode plus: 900 kHz to 1100 kHz

Outside of these frequency intervals, the accuracy is not guaranteed.

$$\text{FREQUENCY} = 2^{12} \times \left\lfloor \frac{2^{20}}{\text{round}\left(\frac{f_{\text{PCLK}}}{\text{desired_frequency}}\right)} \right\rfloor$$

Figure 156: TWIM frequency

- FREQUENCY is the value to be used in the TWIM **FREQUENCY** register.
- f_{PCLK} is the peripheral clock frequency for the TWIM instance, as defined in [Instances](#) on page 696.
- desired_frequency is the desired frequency in hertz, such as 100000 or 400000.

TWIM is started by triggering the DMA.TX.START or DMA.RX.START tasks, and stopped by triggering the STOP task. If TWIM is running when the STOP task is triggered, it stops and generates a STOPPED event.

After TWIM starts, the DMA.TX.START and DMA.RX.START tasks must not be triggered again until TWIM has issued a LASTRX, LASTTX, or STOPPED event.

TWIM can be suspended using the SUSPEND task, which is useful when using TWIM in a low priority interrupt context. When TWIM enters the SUSPEND state, it will automatically issue a SUSPENDED event while performing a continuous clock stretching. This continues until a RESUME task is received. TWIM cannot be stopped while it is suspended. The STOP task must be issued after TWIM resumes operation.

Note: Any ongoing byte transfer is allowed to complete before suspend is enforced. A SUSPEND task has no effect unless TWIM is actively involved in a transfer.

If a NACK is clocked in from the target, TWIM generates an ERROR event.

8.24.2 Shared resources

The TWIM peripheral shares registers and other resources with peripherals that have the same ID as TWIM. Therefore, all peripherals that have the same ID as TWIM must be disabled before TWIM can be configured and used.

Disabling shared peripherals will not reset any of the registers that are shared with TWIM. Configure all relevant TWIM registers to ensure they operate correctly.

See the Instantiation table in [Instantiation](#) on page 232 for details on peripherals and their IDs.

8.24.3 EasyDMA

EasyDMA is implemented by TWIM in order to access RAM without the CPU.

TWIM implements the following EasyDMA channels.

Channel	Type	Register Cluster
TXD	READER	TXD
RXD	WRITER	RXD

Table 66: TWIM EasyDMA channels

The RXD.PTR, TXD.PTR, RXD.MAXCNT, and TXD.MAXCNT registers are double-buffered. They are ready for the next transmission immediately after receiving the EVENTS_DMA.RX.READY or EVENTS_DMA.TX.READY event.

The STOPPED event indicates that EasyDMA is finished accessing the buffer in RAM.

See [EasyDMA](#) on page 29 for more detailed information.

8.24.4 TWIM write sequence

A TWIM write sequence is started by triggering the DMA.TX.START task. After the DMA.TX.START task has been triggered, TWIM generates a start condition on the TWI bus. This is followed by clocking out the address and the READ/WRITE bit set to 0 (WRITE = 0, READ = 1).

The target device address the controller wants to write to must match the clocked address. The READ/WRITE bit is followed by an ACK/NACK bit (ACK = 0 or NACK = 1) generated by the target.

After receiving the ACK bit, TWIM clocks out the data bytes found in the transmit buffer located in RAM at the address specified in the TXD.PTR register. Each byte clocked out from TWIM is followed by an ACK/NACK bit clocked in from the target.

A typical TWIM write sequence including clock stretching performed by TWIM following a SUSPEND task is shown in the following figure.

Figure 157: TWIM writing data to a target

A SUSPENDED event indicates that the SUSPEND task has taken effect.

TWIM will generate a LASTTX event when it starts to transmit the last byte.

TWIM is stopped by triggering the STOP task. To stop TWIM as fast as possible, trigger the task during the transmission of the last byte. The shortcut between LASTTX and STOP can also be used to accomplish this.

TWIM does not stop on its own when the entire RAM buffer has been sent or when an error occurs. The STOP task must be issued, either through the local or PPI shortcut, or in software as part of the error handler.

8.24.5 TWIM read sequence

A TWIM read sequence is started by triggering the DMA.RX.START task. After the DMA.RX.START task has been triggered, TWIM generates a start condition on the TWI bus. This is followed by clocking out the address and the READ/WRITE bit set to 1 (WRITE = 0, READ = 1). The address must match the address of the target device that the controller wants to read from. The READ/WRITE bit is followed by an ACK/NACK bit (ACK = 0 or NACK = 1) generated by the target.

After sending the ACK bit, the TWI target sends data to the controller using the clock generated by TWIM.

Data received will be stored in RAM at the address specified in the RXD.PTR register. TWIM will generate an ACK before the last byte is received from the target. TWIM generates a NACK after the last byte received to indicate that the read sequence will stop.

A typical TWIM read sequence is illustrated in the following figure, including clock stretching performed by TWIM following a SUSPEND task.

Figure 158: TWIM reading data from a target

A SUSPENDED event indicates that the SUSPEND task has taken effect. This event can be used to synchronize the software.

TWIM generates a LASTRX event when it is ready to receive the last byte. If RXD.MAXCNT > 1, the LASTRX event is generated after sending the ACK of the previously received byte. If RXD.MAXCNT = 1, the LASTRX event is generated after receiving the ACK following the address and READ bit.

TWIM is stopped by triggering the STOP task. This task must be triggered before the NACK bit begins transmission. The STOP task can be triggered at any time during the reception of the last byte. It is recommended to use the shortcut between LASTRX and STOP.

TWIM does not stop on its own when the RAM buffer is full or when an error occurs. The STOP task must be issued, either through a local or PPI shortcut, or in software as part of the error handler.

TWIM cannot be stopped while suspended. The STOP task must be issued after TWIM has been resumed.

8.24.6 TWIM repeated start sequence

A typical repeated start sequence is when TWIM writes two bytes to the target followed by reading four bytes from the target. This example uses shortcuts to perform a simple repeated start sequence, with one write followed by one read. The same approach can be used to perform a repeated start sequence where the sequence is read followed by a write.

The following figure shows an example of a repeated start sequence where TWIM writes two bytes to the target followed by reading four bytes from the target.

Figure 159: Controller repeated start sequence

If a more complex repeated start sequence is needed, and the TWI firmware drive is serviced in a low priority interrupt, use the SUSPEND task and SUSPENDED event to ensure that the correct tasks are generated at the correct time. A double repeated start sequence using the SUSPEND task to secure safe operation in low priority interrupts is shown in the following figure.

Figure 160: Double repeated start sequence

8.24.7 Low power

When the peripheral is not needed, stop and disable TWIM for lowest possible power consumption.

When the STOP task is sent, the software must wait until the STOPPED event is received before disabling the peripheral through the ENABLE register. If the peripheral is already stopped, the STOP task is not needed.

8.24.8 TWIM pin configuration

The SCL and SDA signals are mapped to physical pins using the PSEL.SCL and PSEL.SDA registers.

These registers and their configurations are only used when TWIM is enabled, and retained while the device is in System ON mode. When the peripheral is disabled, the pins behave as regular GPIOs and are configured according to their respective OUT bit field and PIN_CNF[n] register. Configure registers PSEL.SCL and PSEL.SDA when TWIM is disabled.

Only one peripheral can be assigned to drive a GPIO pin at a time. If more than one peripheral is assigned to a GPIO pin, it could result in unpredictable behavior.

When TWIM is in System OFF mode or disabled, the pins using TWIM must be configured by the GPIO peripheral according to the following table to ensure correct pin behavior.

TWIM signal	TWIM pin	Drive strength	Direction	Output value
SCL	As specified in PSEL.SCL	S0D1	Input	Not applicable
SDA	As specified in PSEL.SDA	S0D1	Input	Not applicable

Table 67: GPIO configuration before enabling peripheral

8.24.9 Pull-up resistor

1000 kbps bit rate is supported when using H0D1 drive strength, 1 k Ω pull-up resistor, and maximum 50 pF bus capacitance. For other bit rates, see the following figure.

Figure 161: Recommended TWIM pull-up value vs. line capacitance

- The I^2C bus specification allows a maximum line capacitance of 400 pF.
- The value of internal pull-up resistor (R_{PU}) for nRF54LM20A and nRF54LM20B can be found in [GPIO Electrical Specification](#) on page 1259.

TWIM30 : S	GLOBAL	Use GPIO port P0
TWIM30 : NS		Peripheral clock frequency is 16 MHz.

Register overview

Register	Offset	TZ	Description
TASKS_STOP	0x004		Stop TWI transaction. Must be issued while the TWI master is not suspended.
TASKS_SUSPEND	0x00C		Suspend TWI transaction
TASKS_RESUME	0x010		Resume TWI transaction
TASKS_DMA.RX.START	0x028		Starts operation using easyDMA to load the values. See peripheral description for operation using easyDMA.
TASKS_DMA.RX.STOP	0x02C		Stops operation using easyDMA. This does not trigger an END event.
TASKS_DMA.RX.ENABLEMATCH[n]	0x030		Enables the MATCH[n] event by setting the ENABLE[n] bit in the CONFIG register.
TASKS_DMA.RX.DISABLEMATCH[n]	0x040		Disables the MATCH[n] event by clearing the ENABLE[n] bit in the CONFIG register.
TASKS_DMA.TX.START	0x050		Starts operation using easyDMA to load the values. See peripheral description for operation using easyDMA.
TASKS_DMA.TX.STOP	0x054		Stops operation using easyDMA. This does not trigger an END event.
SUBSCRIBE_STOP	0x084		Subscribe configuration for task STOP
SUBSCRIBE_SUSPEND	0x08C		Subscribe configuration for task SUSPEND
SUBSCRIBE_RESUME	0x090		Subscribe configuration for task RESUME
SUBSCRIBE_DMA.RX.START	0x0A8		Subscribe configuration for task START
SUBSCRIBE_DMA.RX.STOP	0x0AC		Subscribe configuration for task STOP
SUBSCRIBE_DMA.RX.ENABLEMATCH[n]	0x0B0		Subscribe configuration for task ENABLEMATCH[n]
SUBSCRIBE_DMA.RX.DISABLEMATCH[n]	0x0C0		Subscribe configuration for task DISABLEMATCH[n]
SUBSCRIBE_DMA.TX.START	0x0D0		Subscribe configuration for task START
SUBSCRIBE_DMA.TX.STOP	0x0D4		Subscribe configuration for task STOP
EVENTS_STOPPED	0x104		TWI stopped
EVENTS_ERROR	0x114		TWI error
EVENTS_SUSPENDED	0x128		SUSPEND task has been issued, TWI traffic is now suspended.
EVENTS_LASTRX	0x134		Byte boundary, starting to receive the last byte
EVENTS_LASTTX	0x138		Byte boundary, starting to transmit the last byte
EVENTS_DMA.RX.END	0x14C		Indicates that the transfer of MAXCNT bytes between memory and the peripheral has been fully completed.
EVENTS_DMA.RX.READY	0x150		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.RX.BUSERROR	0x154		An error occurred during the bus transfer.
EVENTS_DMA.RX.MATCH[n]	0x158		Pattern match is detected on the DMA data bus.

Register	Offset	TZ	Description
EVENTS_DMA.TX.END	0x168		Indicates that the transfer of MAXCNT bytes between memory and the peripheral has been fully completed.
EVENTS_DMA.TX.READY	0x16C		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.TX.BUSERROR	0x170		An error occurred during the bus transfer.
PUBLISH_STOPPED	0x184		Publish configuration for event STOPPED
PUBLISH_ERROR	0x194		Publish configuration for event ERROR
PUBLISH_SUSPENDED	0x1A8		Publish configuration for event SUSPENDED
PUBLISH_LASTRX	0x1B4		Publish configuration for event LASTRX
PUBLISH_LASTTX	0x1B8		Publish configuration for event LASTTX
PUBLISH_DMA.RX.END	0x1CC		Publish configuration for event END
PUBLISH_DMA.RX.READY	0x1D0		Publish configuration for event READY
PUBLISH_DMA.RX.BUSERROR	0x1D4		Publish configuration for event BUSERROR
PUBLISH_DMA.RX.MATCH[n]	0x1D8		Publish configuration for event MATCH[n]
PUBLISH_DMA.TX.END	0x1E8		Publish configuration for event END
PUBLISH_DMA.TX.READY	0x1EC		Publish configuration for event READY
PUBLISH_DMA.TX.BUSERROR	0x1F0		Publish configuration for event BUSERROR
SHORTS	0x200		Shortcuts between local events and tasks
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
ERRORSRC	0x4C4		Error source
ENABLE	0x500		Enable TWIM
FREQUENCY	0x524		TWI frequency. Accuracy depends on the HFCLK source selected.
ADDRESS	0x588		Address used in the TWI transfer
PSEL.SCL	0x600		Pin select for SCL signal
PSEL.SDA	0x604		Pin select for SDA signal
DMA.RX.PTR	0x704		RAM buffer start address
DMA.RX.MAXCNT	0x708		Maximum number of bytes in channel buffer
DMA.RX.AMOUNT	0x70C		Number of bytes transferred in the last transaction, updated after the END event. Also updated after each MATCH event.
DMA.RX.LIST	0x714		EasyDMA list type
DMA.RX.TERMINATEONBUSERROR	0x71C		Terminate the transaction if a BUSERROR event is detected.
DMA.RX.BUSERRORADDRESS	0x720		Address of transaction that generated the last BUSERROR event.
DMA.RX.MATCH.CONFIG	0x724		Configure individual match events
DMA.RX.MATCH.CANDIDATE[n]	0x728		The data to look for - any match will trigger the MATCH[n] event, if enabled.
DMA.TX.PTR	0x73C		RAM buffer start address
DMA.TX.MAXCNT	0x740		Maximum number of bytes in channel buffer
DMA.TX.AMOUNT	0x744		Number of bytes transferred in the last transaction, updated after the END event. Also updated after each MATCH event.
DMA.TX.LIST	0x74C		EasyDMA list type
DMA.TX.TERMINATEONBUSERROR	0x754		Terminate the transaction if a BUSERROR event is detected.
DMA.TX.BUSERRORADDRESS	0x758		Address of transaction that generated the last BUSERROR event.

8.24.10.1 TASKS_STOP

Address offset: 0x004

Stop TWI transaction. Must be issued while the TWI master is not suspended.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

			Disabled	0	Match filter disabled																														
			Enabled	1	Match filter enabled																														
E-H	RW	ONESHOT[i] (i=0..3)			Configure match filter i as one-shot or continuous																														
					One-shot operation will disable the filter on a match, while Continuous operation will keep it enabled until explicitly disabled.																														
			Continuous	0	Match filter stays enabled until disabled by task																														
			Oneshot	1	Match filter stays enabled until next data word is received																														

8.24.10.37.2 DMA.RX.MATCH.CANDIDATE[n] (n=0..3)

Address offset: 0x728 + (n × 0x4)

The data to look for - any match will trigger the MATCH[n] event, if enabled.

Note: This register can be updated while a transfer is in progress, but the new value will not take effect until either the DMA is restarted or the match event is generated. That makes it possible to write a new set of match words which will be searched for immediately after the event triggers.

Bit number					31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

8.25 TWIS — I²C compatible two-wire interface target with EasyDMA

The TWI target peripheral (TWIS) with EasyDMA provides a half duplex, two-wire synchronous serial communication interface.

The main features of TWIS are the following:

- I²C compatible
- Supports 100 kbps and 400 kbps bit rate
- EasyDMA direct transfer to and from RAM
- Individual selection of I/O pins
- Support for clock stretching

Figure 162: TWIS with EasyDMA

A typical TWI setup consists of one controller and one or more targets, as seen in the following figure. Only a single controller can be used on the TWI bus.

Figure 163: Typical TWI setup with one controller and three targets

8.25.1 State machine

The following figure shows the TWIS state machine.

Figure 164: TWIS state machine

The following table contains descriptions of the symbols used in the state machine.

Symbol	Type	Description
ENABLE	Register	TWIS enabled via the ENABLE register.
PREPARETX	Task	The TASKS_PREPARETX task was triggered.
STOP	Task	The TASKS_STOP task was triggered.
PREPARERX	Task	The TASKS_PREPARERX task was triggered.
STOPPED	Event	The EVENTS_STOPPED event was generated.
DMA.RX.READY	Event	The EVENTS_DMA.RX.READY event was generated.
DMA.TX.READY	Event	The EVENTS_DMA.TX.READY event was generated.
TX prepared	Internal	Internal flag indicating that a TASKS_PREPARETX task was triggered.
RX prepared	Internal	Internal flag indicating that a TASKS_PREPARERX task was triggered.
Unprepare TX	Internal	Clears the TX prepared flag until the next TASKS_PREPARETX task.
Unprepare RX	Internal	Clears the RX prepared flag until the next TASKS_PREPARERX task.
Stop condition	TWI protocol	A TWI stop condition was detected.
Restart condition	TWI protocol	A TWI restart condition was detected.

Table 68: TWI slave state machine symbols

TWIS supports clock stretching. In order to use this feature, the controller must also support clock stretching for the feature to execute properly. TWIS operates in a low-power mode while waiting for the TWI controller to initiate a transfer. As long as TWIS is not addressed, it will remain in this mode.

For TWIS to run correctly, PSEL.SCL, PSEL.SDA, CONFIG, and the ADDRESS[n] registers must be configured, the SCL and SDA lines must both be high, before enabling TWIS through the ENABLE register. Similarly, changing these settings must be performed while TWIS is disabled. Failing to do so may result in unpredictable behavior.

8.25.2 Shared resources

The TWIS peripheral shares registers and other resources with peripherals that have the same ID as TWIS. Before TWIS can be configured and used, all peripherals that have the same ID as TWIS must be disabled.

Disabling a peripheral with the same ID as TWIS will not reset any shared TWIS registers. Configure all TWIS registers to ensure they operate correctly.

See the Instantiation table in [Instantiation](#) on page 232 for details on peripherals and their IDs.

8.25.3 EasyDMA

TWIS implements EasyDMA for accessing RAM without CPU involvement.

TWIS implements the EasyDMA channels found in the following table.

Channel	Type	Register Cluster
TXD	READER	TXD
RXD	WRITER	RXD

Table 69: TWIS EasyDMA Channels

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 29.

The STOPPED event indicates that EasyDMA is finished accessing the buffer in RAM.

8.25.4 Read command response

Before TWIS can respond to a read command, it must be configured and enabled in the ENABLE register. When enabled, TWIS is in the IDLE state.

A read command is started when TWIM generates a start condition on the TWI bus. This is followed by clocking out the address and setting the READ/WRITE bit to 1 (READ=1, WRITE=0). The READ/WRITE bit is followed by an ACK/NACK bit (ACK = 0, NACK = 1) response from the TWIS.

TWIS can listen for two addresses at a time. This is configured in the ADDRESS registers and the CONFIG register.

TWIS only acknowledges (ACK) the read command if the address presented by the controller matches one of the addresses the target is configured to listen for. TWIS will generate a READ event when it acknowledges the read command.

TWIS only detects a read command from the IDLE state.

TWIS will set an internal **TX prepared** flag when the PREPARETX task is triggered.

When the read command is received, TWIS will enter the TX state if the internal **TX prepared** flag is set.

If the internal **TX prepared** flag is not set when the read command is received, TWIS will stretch the controller's clock until the PREPARETX task is triggered and the internal **TX prepared** flag is set.

TWIS will generate the EVENTS_DMA.TX.READY event and clear the **TX prepared** flag when it enters the TX state. In this state, TWIS will send the data bytes found in the transmit buffer to the controller using the controller's clock.

TWIS returns to the IDLE state if the TWIS receives a restart command when it is in the TX state.

TWIS is stopped when it receives the stop condition from TWIM. A STOPPED event will be generated when the transaction has stopped. TWIS will clear the **TX prepared** flag and go back to the IDLE state when it has stopped.

The transmit buffer is located in RAM at the address specified in the TXD.PTR register. TWIS will only be able to send TXD.MAXCNT bytes from the transmit buffer for each transaction. If TWIM forces TWIS to send more than TXD.MAXCNT bytes, the target will send the byte specified in the ORC register to the controller instead. If this happens, an ERROR event will be generated.

The EasyDMA configuration registers RXD.PTR, TXD.PTR, RXD.AMOUNT, and TXD.AMOUNT, are latched when the EVENTS_DMA.TX.READY event is generated.

TWIS can be forced to stop by triggering the STOP task. A STOPPED event will be generated when TWIS has stopped. TWIS will clear the **TX prepared** flag and return to the IDLE state when it has stopped, see [Terminate an ongoing TWI transaction](#) on page 728.

Each byte sent from TWIS will be followed by an ACK/NACK bit sent from the controller. TWIM will generate a NACK following the last byte that it wants to receive to tell the target to release the bus allowing TWIM to generate the stop condition. The TXD.AMOUNT register can be queried after a transaction to see how many bytes were sent.

A typical TWIS read command response is illustrated in the following figure, including clock stretching following a SUSPEND task.

Figure 165: TWIS responding to a read command

8.25.5 Write command response

Before TWIS can respond to a write command, TWIS must be configured and enabled in the ENABLE register. When enabled, TWIS is in the IDLE state.

A write command is started when TWIM generates a start condition on the TWI bus. This is followed by clocking out the address and setting the READ/WRITE bit to 0 (READ = 1, WRITE = 0). The READ/WRITE bit is followed by an ACK/NACK bit (ACK = 0, NACK = 1) response from the TWIS.

TWIS can listen for two addresses at a time. This is configured in the ADDRESS registers and the CONFIG register.

TWIS only acknowledges (ACK) the write command if the address presented by the controller matches one of the addresses the target is configured to listen for. TWIS will generate a WRITE event when it acknowledges the write command.

TWIS only detects a write command from the IDLE state.

TWIS will set an internal **RX prepared** flag when the PREPARERX task is triggered.

When the write command is received, TWIS will enter the RX state if the internal **RX prepared** flag is set.

If the internal **RX prepared** flag is not set when the write command is received, TWIS will start stretching the master's clock after the first data byte, not allowing the master to send the stop condition. Clock is stretched until the PREPARERX task is triggered and the internal **RX prepared** flag is set.

TWIS will generate the EVENTS_DMA.RX.READY event and clear the internal **RX prepared** flag when it enters the RX state. In this state, TWIS will be able to receive the bytes sent by the TWIM.

TWIS returns to the IDLE state if TWIS receives a restart command when it is in the RX state.

TWIS is stopped when it receives the stop condition from TWIM. A STOPPED event will be generated when the transaction has stopped. TWIS will clear the internal **RX prepared** flag and go back to the IDLE state when it has stopped.

The receive buffer is located in RAM at the address specified in the RXD.PTR register. TWIS can only receive as many bytes as specified in the RXD.MAXCNT register. If TWIM tries to send more bytes to TWIS than it

can receive, the extra bytes are discarded and NACKed by the target. If this happens, an ERROR event will be generated.

The EasyDMA configuration registers, RXD.PTR, TXD.PTR, RXD.AMOUNT, and TXD.AMOUNT, are latched when the EVENTS_DMA.RX.READY event is generated.

TWIS can be forced to stop by triggering the STOP task. A STOPPED event will be generated when TWIS has stopped. TWIS will clear the internal **RX prepared** flag and return to the IDLE state when it has stopped, see [Terminate an ongoing TWI transaction](#) on page 728.

TWIS will generate an ACK after every byte received from the controller. The RXD.AMOUNT register can be queried after a transaction to see how many bytes were received.

A typical TWIS write command response is illustrated in the following figure, including clock stretching following a SUSPEND task.

Figure 166: TWIS responding to a write command

8.25.6 TWI controller repeated start sequence

A repeated start sequence is where the TWI controller writes two bytes to TWIS, followed by reading four bytes from the target. This is shown in the following figure.

Figure 167: Repeated start sequence

In this example, the receiver does not know in advance what the controller wants to read. This information is in the first two received bytes of the write in the repeated start sequence. For the CPU to process the received data before TWIS replies to the read command, the SUSPEND task is triggered. This is enabled through a shortcut from the READ event generated when the read command is received. When the CPU has processed the incoming data and prepared the correct data response, the CPU will resume the transaction by triggering the RESUME task.

8.25.7 Terminate an ongoing TWI transaction

In some situations, an ongoing transaction must be terminated. This can happen when the external TWI controller is not responding correctly, for example.

To stop an ongoing transaction, trigger the STOP task. A STOPPED event will be generated when TWIS stops. It is not dependent on the STOP condition being generated on the TWI bus. TWIS will release the bus when it has stopped and returns to its IDLE state.

8.25.8 Low power

When the peripheral is not needed, stop and disable TWIS for lowest possible power consumption.

When the STOP task is sent, the software must wait until the STOPPED event is received before disabling the peripheral through the ENABLE register. If the peripheral is already stopped, the STOP task is not needed.

8.25.9 Target mode pin configuration

The SCL and SDA signals are mapped to physical pins using the PSEL.SCL and PSEL.SDA registers.

The PSEL.SCL and PSEL.SDA registers and their configurations are only used when TWIS is enabled, and retained while the device is in System ON mode. When the peripheral is disabled, the pins function as regular GPIOs, and use the configuration in their respective OUT bit field and PIN_CNF[n] register. Only configure PSEL.SCL and PSEL.SDA when TWIS is disabled.

When in System OFF mode or when TWIS is disabled, the TWIS pins must be configured in the GPIO peripheral as described in the following table to secure correct signal levels.

Only one peripheral can be assigned to drive a GPIO pin at a time. Failing to do so may result in unpredictable behavior.

TWIS signal	TWIS pin	Direction	Output value	Drive strength
SCL	As specified in PSEL.SCL	Input	Not applicable	S0D1
SDA	As specified in PSEL.SDA	Input	Not applicable	S0D1

Table 70: GPIO configuration before enabling peripheral

Register overview

Register	Offset	TZ	Description
TASKS_STOP	0x004		Stop TWI transaction
TASKS_SUSPEND	0x00C		Suspend TWI transaction
TASKS_RESUME	0x010		Resume TWI transaction
TASKS_PREPARERX	0x020		Prepare the TWI slave to respond to a write command
TASKS_PREPARETX	0x024		Prepare the TWI slave to respond to a read command
TASKS_DMA.RX.ENABLEMATCH[n]	0x030		Enables the MATCH[n] event by setting the ENABLE[n] bit in the CONFIG register.
TASKS_DMA.RX.DISABLEMATCH[n]	0x040		Disables the MATCH[n] event by clearing the ENABLE[n] bit in the CONFIG register.
SUBSCRIBE_STOP	0x084		Subscribe configuration for task STOP
SUBSCRIBE_SUSPEND	0x08C		Subscribe configuration for task SUSPEND
SUBSCRIBE_RESUME	0x090		Subscribe configuration for task RESUME
SUBSCRIBE_PREPARERX	0x0A0		Subscribe configuration for task PREPARERX
SUBSCRIBE_PREPARETX	0x0A4		Subscribe configuration for task PREPARETX
SUBSCRIBE_DMA.RX.ENABLEMATCH[n]	0x0B0		Subscribe configuration for task ENABLEMATCH[n]
SUBSCRIBE_DMA.RX.DISABLEMATCH[n]	0x0C0		Subscribe configuration for task DISABLEMATCH[n]
EVENTS_STOPPED	0x104		TWI stopped
EVENTS_ERROR	0x114		TWI error
EVENTS_WRITE	0x13C		Write command received
EVENTS_READ	0x140		Read command received
EVENTS_DMA.RX.END	0x14C		Generated after EasyDMA has completed its operation.
EVENTS_DMA.RX.READY	0x150		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.RX.BUSERROR	0x154		An error occurred during the bus transfer.
EVENTS_DMA.RX.MATCH[n]	0x158		Pattern match is detected on the DMA data bus.
EVENTS_DMA.TX.END	0x168		Generated after EasyDMA has completed its operation.
EVENTS_DMA.TX.READY	0x16C		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.TX.BUSERROR	0x170		An error occurred during the bus transfer.
PUBLISH_STOPPED	0x184		Publish configuration for event STOPPED
PUBLISH_ERROR	0x194		Publish configuration for event ERROR
PUBLISH_WRITE	0x1BC		Publish configuration for event WRITE
PUBLISH_READ	0x1C0		Publish configuration for event READ
PUBLISH_DMA.RX.END	0x1CC		Publish configuration for event END
PUBLISH_DMA.RX.READY	0x1D0		Publish configuration for event READY
PUBLISH_DMA.RX.BUSERROR	0x1D4		Publish configuration for event BUSERROR
PUBLISH_DMA.RX.MATCH[n]	0x1D8		Publish configuration for event MATCH[n]
PUBLISH_DMA.TX.END	0x1E8		Publish configuration for event END
PUBLISH_DMA.TX.READY	0x1EC		Publish configuration for event READY
PUBLISH_DMA.TX.BUSERROR	0x1F0		Publish configuration for event BUSERROR
SHORTS	0x200		Shortcuts between local events and tasks
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
ERRORSRC	0x4D0		Error source
MATCH	0x4D4		Status register indicating which address had a match
ENABLE	0x500		Enable TWIS
ADDRESS[n]	0x588		TWI slave address n
CONFIG	0x594		Configuration register for the address match mechanism
ORC	0x5C0		Over-read character. Character sent out in case of an over-read of the transmit buffer.
PSEL.SCL	0x600		Pin select for SCL signal
PSEL.SDA	0x604		Pin select for SDA signal
DMA.RX.PTR	0x704		RAM buffer start address

Register	Offset	TZ	Description
DMA.RX.MAXCNT	0x708		Maximum number of bytes in channel buffer
DMA.RX.AMOUNT	0x70C		Number of bytes transferred in the last transaction, updated after the END event. For channels that supports the compare match filter, this register is also updated after each MATCH event.
DMA.RX.LIST	0x714		EasyDMA list type
DMA.RX.TERMINATEONBUSERROR	0x71C		Terminate the transaction if a BUSERROR event is detected.
DMA.RX.BUSERRORADDRESS	0x720		Address of transaction that generated the last BUSERROR event.
DMA.RX.MATCH.CONFIG	0x724		Configure individual match events
DMA.RX.MATCH.CANDIDATE[n]	0x728		The data to look for - any match will trigger the MATCH[n] event, if enabled.
DMA.TX.PTR	0x73C		RAM buffer start address
DMA.TX.MAXCNT	0x740		Maximum number of bytes in channel buffer
DMA.TX.AMOUNT	0x744		Number of bytes transferred in the last transaction, updated after the END event. For channels that supports the compare match filter, this register is also updated after each MATCH event.
DMA.TX.LIST	0x74C		EasyDMA list type
DMA.TX.TERMINATEONBUSERROR	0x754		Terminate the transaction if a BUSERROR event is detected.
DMA.TX.BUSERRORADDRESS	0x758		Address of transaction that generated the last BUSERROR event.

8.25.10.1 TASKS_STOP

Address offset: 0x004

Stop TWI transaction

8.26 UARTE — Universal asynchronous receiver/transmitter with EasyDMA

The Universal asynchronous receiver/transmitter with EasyDMA peripheral (UARTE) provides a full-duplex, asynchronous serial communication interface with hardware flow control.

The main features of UARTE are the following:

- Full-duplex operation
- EasyDMA direct transfer to and from RAM
- Individual selection of I/O pins
- Optional even and odd parity bit checking and generation
- One or two stop bits
- Configurable data frame size: 4 bit to 9 bit
- 9-bit mode support with address matching in RX
- Automatic hardware flow control
- Supports return to the IDLE state between transactions (when using HW flow control)
- Interrupt generation after programmable timeout
- Compare match filter for generating events or interrupts

Figure 168: UARTE configuration

Note: The external crystal oscillator must be enabled to obtain sufficient clock accuracy for stable communication. See [CLOCK — Clock control](#) on page 72 for more information.

8.26.1 Baudrate

The UART baudrate defines the speed at which data is transmitted over the UART interface, measured in bits per second (bps).

The [BAUDRATE](#) register lists a set of precalculated values for the most common baudrates and 16 MHz PCLK. For the high speed instances (PCLK > 16 MHz), the baudrate is calculated as follows:

$$\text{BAUDRATE} = 2^{12} \times \left\lfloor \frac{2^{20}}{\text{round}\left(\frac{f_{\text{PCLK}}}{\text{desired_baudrate}}\right)} \right\rfloor$$

Figure 169: UARTE baudrate

- BAUDRATE is the value to be used in the UARTE [BAUDRATE](#) register.
- f_{PCLK} is the peripheral clock frequency for the UARTE instance, as defined in [Instances](#) on page 760.
- desired_baudrate is the desired baudrate in bits per second, such as 9600 or 115200.

8.26.2 EasyDMA

UARTE implements EasyDMA for reading and writing to and from RAM.

If the DMA.TX.PTR and the DMA.RX.PTR are not pointing to the RAM region, an EasyDMA transfer may result in a HardFault or RAM corruption. See [Memory](#) on page 13 for more information about each memory region.

The DMA.RX.PTR, DMA.TX.PTR, DMA.RX.MAXCNT, and DMA.TX.MAXCNT registers are double-buffered. They can be updated and prepared for the next reception or transmission immediately after having received the DMA.RX.READY or DMA.TX.READY events.

The DMA.RX.END and DMA.TX.END events indicate that the EasyDMA is finished accessing the RX or TX buffer in RAM.

For detailed information regarding the use of EasyDMA, see [EasyDMA](#) on page 29.

8.26.3 Transmission

The first step of a DMA transmission is storing bytes in the transmit buffer and configuring EasyDMA. This is achieved by writing the initial address pointer to DMA.TX.PTR, and the number of bytes to transmit from the RAM buffer to DMA.TX.MAXCNT. The UARTe transmission is started by triggering the DMA.TX.START task.

After each byte has been sent over the TXD line, a TXDRDY event is generated.

When then bytes have been transmitted, the DMA.TX.END event is generated.

A UARTe transmission sequence is stopped by triggering the DMA.TX.STOP task. A TXSTOPPED event will be generated when the UARTe transmitter has stopped.

If the DMA.TX.END event has not been generated when the UARTe transmitter stops, UARTe will generate the DMA.TX.END event explicitly even though all bytes specified in the DMA.TX.MAXCNT register have not been transmitted.

If flow control is enabled in the HWFC field in the CONFIG register, a transmission will be automatically suspended when CTS is deactivated, and resumed when CTS is activated again, as shown in the following figure. A byte that is in transmission when CTS is deactivated will finish transmitting before the transmission is suspended.

Figure 170: UARTe transmission

The UARTe transmitter is least active when it is stopped, consuming the least amount of energy. This is before it is started via DMA.TX.START, or after it has been stopped via DMA.TX.STOP and the TXSTOPPED event has been generated. See [POWER — Power control](#) on page 100 for more information about power modes.

8.26.4 Reception

The UARTe receiver is started by triggering the DMA.RX.START task. The UARTe receiver uses EasyDMA to store incoming data in an RX buffer in RAM.

The RX buffer is located at the address specified in the DMA.RX.PTR register. The DMA.RX.PTR register is double-buffered and can be updated and prepared for the next DMA.RX.START task immediately after the EVENTS_DMA.RX.READY event is generated. The size of the RX buffer is specified in the DMA.RX.MAXCNT register. UARTE generates an DMA.RX.END event when it has filled up the RX buffer, as seen in the following figure.

For each byte received over the RXD line, an RXDRDY event is generated. This event is likely to occur before the corresponding data has been transferred to RAM.

The DMA.RX.AMOUNT register can be queried following an DMA.RX.END event to see how many new bytes have been transferred to the RX buffer in RAM since the previous DMA.RX.END event.

Figure 171: UARTE reception

The UARTE receiver is stopped by triggering the DMA.RX.STOP task. The RXTO and DMA.RX.END events are generated when UARTE has stopped.

Stopping the UARTE with a RX buffer that is empty or not completely filled up will also cause the DMA.RX.END event to be generated.

The number of bytes stored in the RX buffer can be found by reading the DMA.RX.AMOUNT register following the DMA.RX.END event.

To stop UARTE, trigger the DMA.RX.STOP task. After the STOP task is triggered, UARTE can receive up to four bytes during the timeout period. The data received during the timeout period will be written to DMA.RX.PTR, and limited by DMA.RX.MAXCNT registers. MAXCNT should be set to at least four bytes to

allow for this, while following the DMA.RX.END event, the DMA.RX.AMOUNT register will indicate the actual number of bytes received.

Figure 172: UARTE reception with forced stop through DMA.RX.STOP

If hardware flow control is enabled in the HWFC field in the CONFIG register, the RTS signal will be deactivated when the receiver is stopped via the DMA.RX.STOP task, or when UARTE can only receive three more bytes in its internal RX FIFO.

With flow control disabled, the UARTE will function in the same way as when the flow control is enabled, except that the RTS line will not be used. This means that no signal will be generated when UARTE is only able to receive three additional bytes in its internal RX FIFO. Data received when the internal RX FIFO is full, will be lost.

The UARTE receiver is least active when it is stopped, consuming the least amount of energy. This is before it is started via DMA.RX.START, or after it has been stopped via DMA.RX.STOP and the RXTO event has been generated. See [POWER — Power control](#) on page 100 for more information about power modes.

8.26.5 Data frame size

UARTE implements a configurable data frame size of 4 bits to 9 bits and is set in the register [CONFIG](#) on page 783. If a value greater than 9 or less than 4 is written to this register, the frame size will be set to 8 bits and the register will read back a value of 8.

When UARTE is used with the 9 bit frame size, a 9th bit is added after the MSB of the 8 bit data frame, and before the parity and stop bits, as shown in the following figure. This bit indicates if the 8 bit data is an address or data. If the 9th bit is 1, the 8 bit data is interpreted as an address. If the 9th bit is 0, the 8 bit data is interpreted as data.

Figure 173: UARTE frame

When UART is in RX configured with a 9 bit frame size, all frames are ignored until a frame with the address bit set is received, and the 8 remaining bits of the data frame matches the address set in the register [ADDRESS](#) on page 784. The frames following the matching address are received as an 8 bit data frame until the next frame where the address bit set is received, the address bit is not stored. If the address does not match [ADDRESS](#), the following frames are ignored.

If the parity bit is enabled, the address bit is not included in the parity calculation.

When UART TX is started, the first byte in the buffer read by EasyDMA is treated as an address, and transmitted with the address bit set to 1. The next bits in the buffer are treated as data and transmitted with the address bit set to 0.

When UARTE uses a data frame size less than an 8 bits, the data is trimmed from an 8 bit frame size in the RAM buffer for TX, and padded before being stored in the RAM buffer for RX. The ENDIAN field in the register [CONFIG](#) defines if the data is trimmed from MSB or LSB of the 8 bit buffer frame.

8.26.6 Frame timeout interrupt

UARTE can generate an event after a programmable timeout.

If enabled with the FRAMETIMEOUT field in register [CONFIG](#) on page 783, a counter starts at the start flag, and counts the number of bit periods given in register [FRAMETIMEOUT](#) on page 784. The period time of the counter is equal to the period of one bit on the UART TX line given by the [BAUDRATE](#) register. When the timeout expires, the event [EVENTS_FRAMETIMEOUT](#) is generated. The STOP task also stops the timeout counter. UARTE reception can be stopped on timeout by setting the short from the [FRAMETIMEOUT](#) event to the [DMA.RX.STOP](#) task in register [SHORTS](#) on page 776.

This feature can be used to support variable length UART transmission with no end of transmission tag. After the last UART frames are received within the configured timeout, an interrupt is generated and the data can be processed.

The following figure shows an example where the UART receives a transmission that times out after byte 12.

Figure 174: UARTE reception frame timeout

The minimum value of the **FRAMETIMEOUT** register must be set to a value larger than the configured UART frame length.

Note: Frames received after the RXTO event are discarded and not stored in memory. Reception will commence when DMA.RX.START is triggered.

8.26.7 Error conditions

An ERROR event, in the form of a framing error, will be generated if a valid stop bit is not detected in a frame. Another ERROR event, in the form of a break condition, will be generated if the RXD line is held active low for longer than the length of a data frame. A framing error is always generated before a break condition occurs.

An ERROR event will not stop reception. If the error was a parity error, the received byte is still transferred into RAM along with any following bytes. If a framing error occurs (wrong stop bit), that byte will not be stored in RAM but the next incoming bytes will.

8.26.8 Using the UARTE without flow control

If flow control is not enabled, the interface will behave as if the CTS and RTS lines are held active.

8.26.9 Parity and stop bit configuration

Automatic even parity generation for both transmission and reception can be configured using the register **CONFIG** on page 783. If odd parity is required, it can be configured using the register **CONFIG** on page 783. See the register description for details.

The amount of stop bits can be configured in the register [CONFIG](#) on page 783.

8.26.10 Compare match filter

UARTE has a compare match filter that can watch for a specific sequence of data. This feature is implemented in EasyDMA on the RX channel.

UARTE can generate events or interrupts when the specific data sequence is received. The event [EVENTS_DMA.RX.MATCH\[n\] \(n=0..3\)](#) on page 770 is generated when there is a match in the data stream being received. The number of [MATCH](#) can be different for each instance. See [Registers](#) on page 760 for how many [MATCH](#) events are implemented per instance.

Register [DMA.RX.MATCH.CANDIDATE\[n\] \(n=0..3\)](#) on page 788 configures the pattern for comparison. The filter is enabled with the corresponding ENABLE bit in register [DMA.RX.MATCH.CONFIG](#) on page 787. The [DMA.RX.ENABLEMATCH](#) task can be used to set that bit, and the [DMA.RX.DISABLEMATCH](#) task will clear that bit. If the [ONESHOT\[i\]](#) field in the [CONFIG](#) register is set, the corresponding [ENABLE\[i\]](#) bit will be cleared on a successful match.

For detailed information regarding the use of pattern matching in the EasyDMA engine, see [EasyDMA](#) on page 29.

8.26.11 Low power

To ensure lowest possible power consumption when the peripheral is not needed, stop and disable UARTE.

The [DMA.TX.STOP](#) and [DMA.RX.STOP](#) tasks are not always needed (the peripheral might already be stopped). If [DMA.TX.STOP](#) or [DMA.RX.STOP](#) is sent, software waits until the [TXSTOPPED](#) or [RXTO](#) event is received before disabling the peripheral through the [ENABLE](#) register.

8.26.12 Pin configuration

The [RXD](#), [CTS](#) (Clear To Send, active low), [RTS](#) (Request To Send, active low), and [TXD](#) signals associated with UARTE are mapped to physical pins according to the configuration specified in the [PSEL.n](#) registers.

These registers and their configurations are only used when UARTE is enabled, and retained while the device is in System ON mode. The [PSEL.n](#) registers can be configured only when UARTE is disabled.

To ensure correct behavior when in System OFF mode, the pins must be configured in the GPIO peripheral as described in the following table.

Only one peripheral can be assigned to drive a particular GPIO pin at a time. Failing to do so may result in unpredictable behavior.

UARTE signal	UARTE pin	Direction	Output value
RXD	As specified in PSEL.RXD	Input	Not applicable
CTS	As specified in PSEL.CTS	Input	Not applicable
RTS	As specified in PSEL.RTS	Output	1
TXD	As specified in PSEL.TXD	Output	1

		Use GPIO port P0
		Supports up to 1 Mbps
		Timeout interrupt is included.
		Supports data frame sizes 4, 5, 6, 7, 8, and 9 bits.

Register overview

Register	Offset	TZ	Description
TASKS_FLUSHRX	0x01C		Flush RX FIFO into RX buffer
TASKS_DMA.RX.START	0x028		Starts operation using easyDMA to load the values. See peripheral description for operation using easyDMA.
TASKS_DMA.RX.STOP	0x02C		Stops operation using easyDMA. This does not trigger an END event.
TASKS_DMA.RX.ENABLEMATCH[n]	0x030		Enables the MATCH[n] event by setting the ENABLE[n] bit in the CONFIG register.
TASKS_DMA.RX.DISABLEMATCH[n]	0x040		Disables the MATCH[n] event by clearing the ENABLE[n] bit in the CONFIG register.
TASKS_DMA.TX.START	0x050		Starts operation using easyDMA to load the values. See peripheral description for operation using easyDMA.
TASKS_DMA.TX.STOP	0x054		Stops operation using easyDMA. This does not trigger an END event.
SUBSCRIBE_FLUSHRX	0x09C		Subscribe configuration for task FLUSHRX
SUBSCRIBE_DMA.RX.START	0x0A8		Subscribe configuration for task START
SUBSCRIBE_DMA.RX.STOP	0x0AC		Subscribe configuration for task STOP
SUBSCRIBE_DMA.RX.ENABLEMATCH[n]	0x0B0		Subscribe configuration for task ENABLEMATCH[n]
SUBSCRIBE_DMA.RX.DISABLEMATCH[n]	0x0C0		Subscribe configuration for task DISABLEMATCH[n]
SUBSCRIBE_DMA.TX.START	0x0D0		Subscribe configuration for task START
SUBSCRIBE_DMA.TX.STOP	0x0D4		Subscribe configuration for task STOP
EVENTS_CTS	0x100		CTS is activated (set low). Clear To Send.
EVENTS_NCTS	0x104		CTS is deactivated (set high). Not Clear To Send.
EVENTS_TXDRDY	0x10C		Data sent from TXD
EVENTS_RXDRDY	0x110		Data received in RXD (but potentially not yet transferred to Data RAM)
EVENTS_ERROR	0x114		Error detected
EVENTS_RXTO	0x124		Receiver timeout
EVENTS_TXSTOPPED	0x130		Transmitter stopped
EVENTS_DMA.RX.END	0x14C		Generated after EasyDMA has completed its operation.
EVENTS_DMA.RX.READY	0x150		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.RX.BUSERROR	0x154		An error occurred during the bus transfer.
EVENTS_DMA.RX.MATCH[n]	0x158		Pattern match is detected on the DMA data bus.
EVENTS_DMA.TX.END	0x168		Generated after EasyDMA has completed its operation.
EVENTS_DMA.TX.READY	0x16C		Generated when EasyDMA has buffered the .PTR and .MAXCNT registers for the channel, allowing them to be written to prepare for the next sequence.
EVENTS_DMA.TX.BUSERROR	0x170		An error occurred during the bus transfer.
EVENTS_FRAMETIMEOUT	0x174		Timed out due to bus being idle while receiving data.
PUBLISH_CTS	0x180		Publish configuration for event CTS
PUBLISH_NCTS	0x184		Publish configuration for event NCTS
PUBLISH_TXDRDY	0x18C		Publish configuration for event TXDRDY
PUBLISH_RXDRDY	0x190		Publish configuration for event RXDRDY
PUBLISH_ERROR	0x194		Publish configuration for event ERROR
PUBLISH_RXTO	0x1A4		Publish configuration for event RXTO
PUBLISH_TXSTOPPED	0x1B0		Publish configuration for event TXSTOPPED
PUBLISH_DMA.RX.END	0x1CC		Publish configuration for event END
PUBLISH_DMA.RX.READY	0x1D0		Publish configuration for event READY
PUBLISH_DMA.RX.BUSERROR	0x1D4		Publish configuration for event BUSERROR
PUBLISH_DMA.RX.MATCH[n]	0x1D8		Publish configuration for event MATCH[n]
PUBLISH_DMA.TX.END	0x1E8		Publish configuration for event END
PUBLISH_DMA.TX.READY	0x1EC		Publish configuration for event READY
PUBLISH_DMA.TX.BUSERROR	0x1F0		Publish configuration for event BUSERROR
PUBLISH_FRAMETIMEOUT	0x1F4		Publish configuration for event FRAMETIMEOUT
SHORTS	0x200		Shortcuts between local events and tasks
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt

Register	Offset	TZ	Description
INTENCLR	0x308		Disable interrupt
ERRORSRC	0x480		Error source
ENABLE	0x500		Enable UART
BAUDRATE	0x524		Baud rate. Accuracy depends on the HFCLK source selected.
CONFIG	0x56C		Configuration of parity, hardware flow control, framesize, and packet timeout.
ADDRESS	0x574		Set the address of the UARTE for RX when used in 9 bit data frame mode.
FRAMETIMEOUT	0x578		Set the number of UARTE bits to count before triggering packet timeout.
PSEL.TXD	0x604		Pin select for TXD signal
PSEL.CTS	0x608		Pin select for CTS signal
PSEL.RXD	0x60C		Pin select for RXD signal
PSEL.RTS	0x610		Pin select for RTS signal
DMA.RX.PTR	0x704		RAM buffer start address
DMA.RX.MAXCNT	0x708		Maximum number of bytes in channel buffer
DMA.RX.AMOUNT	0x70C		Number of bytes transferred in the last transaction, updated after the END event. For channels that supports the compare match filter, this register is also updated after each MATCH event.
DMA.RX.LIST	0x714		EasyDMA list type
DMA.RX.TERMINATEONBUSERROR	0x71C		Terminate the transaction if a BUSERROR event is detected.
DMA.RX.BUSERRORADDRESS	0x720		Address of transaction that generated the last BUSERROR event.
DMA.RX.MATCH.CONFIG	0x724		Configure individual match events
DMA.RX.MATCH.CANDIDATE[n]	0x728		The data to look for - any match will trigger the MATCH[n] event, if enabled.
DMA.TX.PTR	0x73C		RAM buffer start address
DMA.TX.MAXCNT	0x740		Maximum number of bytes in channel buffer
DMA.TX.AMOUNT	0x744		Number of bytes transferred in the last transaction, updated after the END event. For channels that supports the compare match filter, this register is also updated after each MATCH event.
DMA.TX.LIST	0x74C		EasyDMA list type
DMA.TX.TERMINATEONBUSERROR	0x754		Terminate the transaction if a BUSERROR event is detected.
DMA.TX.BUSERRORADDRESS	0x758		Address of transaction that generated the last BUSERROR event.

ID	R/W	Field	Value ID	Value		Description																																						
A-D	RW	ENABLE[i] (i=0..3)				Enable match filter i																																						
			Disabled	0	Match filter disabled																																							
			Enabled	1	Match filter enabled																																							
E-H	RW	ONESHOT[i] (i=0..3)				Configure match filter i as one-shot or continuous																																						
						One-shot operation will disable the filter on a match, while Continuous operation will keep it enabled until explicitly disabled.																																						
			Continuous	0	Match filter stays enabled until disabled by task																																							
			Oneshot	1	Match filter stays enabled until next data word is received																																							

8.26.13.43.2 DMA.RX.MATCH.CANDIDATE[n] (n=0..3)

Address offset: 0x728 + (n × 0x4)

The data to look for - any match will trigger the MATCH[n] event, if enabled.

Note: This register can be updated while a transfer is in progress, but the new value will not take effect until either the DMA is restarted or the match event is generated. That makes it possible to write a new set of match words which will be searched for immediately after the event triggers.

Bit number					31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

8.27 USBHS — Universal Serial Bus High Speed

The USBHS (USB high speed) peripheral is a USB 2.0 device that supports USB 2.0 and is backward compatible with the USB 1.1 Specification.

The following are main features of USBHS:

- Multiple DMA/non-DMA mode access support for the application
- Supports up to 16 bidirectional endpoints, including control endpoint 0
- Supports the following modes:
 - High-speed (HS) 480 Mbps
 - Full-speed (FS) 12 Mbps
 - Low-speed (LS) 1.5 Mbps
 - Configurable device mode
- Includes automatic ping capabilities
- Supports keep-alive in low-speed mode and SOFs in high- and full-speed modes
- Provides on-chip PLL to reduce clock noise and eliminate the need for an external clock generator
- Supports battery charging, enabling a device to draw current in excess of the USB 2.0 specification for charging or powering up from dedicated charging ports or charging downstream ports
- Does not support On-The-Go (OTG)

8.27.1 USB pins

The USBHS peripheral features a number of dedicated pins which can be grouped into two categories: signal and power.

Signal pins connect to the USB device and consist of the **D+** and **D-** pins. These are dedicated pins and not available as standard GPIO pins. The data line does not need serial resistors. **TXRTUNE** connects to a tuning resistor on the PCB. The USBHS does not have an **ID** pin. The USBHS peripheral is implemented according to the [USB Specification v2.0, 5V Short Circuit Withstand ECU Requirement Change](#), meaning these pins are not 5 V tolerant.

See [Reference circuitry](#) on page 1246 for the reference circuit diagram.

The signal pins are operational when the following are true:

- The device is powered
- **VBUS** is in the valid voltage range
- USBHS is enabled by the software driver

Note: The **D+** and **D-** pins are impedance controlled signals and must be routed on the PCB according to the USB standard. See the development kit user guide for a routing example.

TXRTUNE resistor

An external resistor with 200 Ω resistance and 1% tolerance must be connected from the **TXRTUNE** pin to the **VSS** pin to calibrate a 45 Ω source impedance for the **D+** and **D-** pins. Using a constant current output from the **TXRTUNE** pin and measuring the voltage over the external resistor, the nominal voltage over the resistor will be 400 mV.

VBUS detection

The **VBUS** pin has a voltage detector for both rising and falling voltage. This means it will detect the USB cable being connected and disconnected. The voltage detector generates events that are picked up by the USBHS software driver, which can be used as wakeup-sources for the device.

For pin assignments, see [Pin assignments](#) on page 1219.

8.27.2 Interrupt sharing

USBHS and USBHSCORE share the same interrupt, and interrupts are generated through USBHS.

The interrupts are enabled and disabled using the mechanisms available in USBHSCORE, using registers such as [USBHSCORE.GINTSTS](#) and [USBHSCORE.GINTMSK](#).

8.27.3 USBHS not in use

If USBHS is not used in an application, the following applies.

All USBHS pins can be left floating (not connected). See [USB pins](#) on page 790 for the list of USBHS pins.

Do not enable USBHS or the USB regulator.

8.27.4 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
USBHS : S	GLOBAL	0x5005A000	US	S	SA	No	USBHS
USBHS : NS		0x4005A000					

Configuration

Instance	Domain	Configuration
		Has Start of Frame (SOF) event.
USBHS : S	GLOBAL	RTUNE method for calibrating DP and DM 45Ohm source impedance without external TXRTUNE resistor available.
USBHS : NS		Includes STATUS register

Register overview

Register	Offset	TZ	Description
TASKS_START	0x000		Start the USB peripheral.
TASKS_STOP	0x004		Stop the USB peripheral
PUBLISH_SOF	0x180		Publish configuration for SOF event.
ENABLE	0x400		Enable USB peripheral.
STATUS	0x408		This register contains status bits for the USBHS
PHY.CONFIG	0x440		USB PHY parameter overrides
PHY.CLOCK	0x444		USB PHY clock configurations
PHY.BATTCHRG	0x448		Battery Charging Configuration
PHY.BATTCHRGSTATUS	0x44C		Battery charger input signals
PHY.INPUTOVERRIDE	0x458		Enables overriding of individual signals to the PHY, the override values are set in PHY.OVERRIDEVALUES

Register	Offset	TZ	Description
PHY.OVERRIDEVALUES	0x45C		Values that are used to override the input signals to the PHY.
PHY.RTUNE	0x464		The RTUNE mode is an alternative method for calibrating the DP and DM 45-Ohm source impedance.

8.27.4.1 TASKS_START

Address offset: 0x000

Start the USB peripheral.

To start USB peripheral, it needs to be enabled using the ENABLE register first.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value		Description																													
A	W	TASKS_START				Start the USB peripheral.																													
						To start USB peripheral, it needs to be enabled using the ENABLE register first.																													
			Trigger	1		Trigger task																													

8.27.4.2 TASKS_STOP

Address offset: 0x004

Stop the USB peripheral

This bit can be cleared to disable the clock to the USB core. By default the clock is enabled when ENABLE.CORE is set. To enable the clock again run the START task.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

A	W	TASKS_STOP				Stop the USB peripheral																													
						This bit can be cleared to disable the clock to the USB core. By default the clock is enabled when ENABLE.CORE is set. To enable the clock again run the START task.																													
				Trigger		1 Trigger task																													

8.27.4.3 PUBLISH_SOF

Address offset: 0x180

Publish configuration for SOF event.

In Host mode, this event triggers every time a Start Of Frame (SOF) is generated in the USB controller. In Device mode, this signal triggers every time a SOF token is received from the USB host or when a SOF token is missed at the start of frame.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

			Host	0	Role is Host.																													

8.27.4.12 PHY.RTUNE

Address offset: 0x464

The RTUNE mode is an alternative method for calibrating the DP and DM 45-Ohm source impedance.

When this method is used, the USBHS REXT resistor does not need to be connected and can be left floating. This RTUNE mode is selected by setting RTUNESEL to 0, and the tune calibration value is set by the RCALCODE input bus.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				B B B B A																															
Reset 0x0000000F				0 1 1 1 1																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW	RTUNESEL			This signal selects the tuning method for the high-speed DP and DM source impedance of the USBHS.																														
			TXRTUNE	1	The TXRTUNE pin, external resistor REXT, and resulting internal digital calibration code are used for tuning the high-speed source impedance.																														
			RTUNE	0	The RCALCODE value is used for tuning the high-speed source impedance.																														
B	RW	RCALCODE			This signal is used to tune the internal 200 ohm resistor or the USBHS DP and DM high-speed source impedance.																														
					All values from 4'b1111 to 4'b0000 are valid. A value of 4'b1111 provides the lowest impedance on DP/DM, and a value of 4'b0000 provides the highest impedance on DP/DM

ID	R/W	Field	Value ID	Value	Description																														
H	R	CONIDSTS			Mode: Host and Device. Connector ID Status (ConIDSts)																														
					Indicates the connector ID status on a connect event. Note: The reset value of this register field can be read only after the PHY clock is stable, or if IDDIG_FILTER is enabled, wait for the filter timer to expire to read the correct reset value which ever event is later. Reset: - 1'b0: in host only mode (OTG_MODE = 5 or 6) - 1'b1: in all other configurations																														
			MODEA	0	The core is in A-Device mode.																														
			MODEB	1	The core is in B-Device mode.																														
I	R	DBNCTIME			Mode: Host only. Long/Short Debounce Time (DbncTime)																														
					Indicates the debounce time of a detected connection.																														
			LONG	0	Long debounce time, used for physical connections (100 ms + 2.5 micro-sec)																														
	SHORT	1	Short debounce time, used for soft connections (2.5 micro-sec)																																
J	R	ASESVLD			Mode: Host only. A-Session Valid (ASesVld)																														
					Indicates the Host mode transceiver status. Note: If you do not enabled OTG features (such as SRP and HNP), the read reset value will be 1. The vbus assigns the values internally for non-SRP or non-HNP configurations. In case of OTG_MODE=0, the reset value of this bit is 1'b0.																														
			NOTVALID	0	A-session is not valid.																														
	VALID	1	A-session is valid.																																
K	R	BSESVLD			Mode: Device only. B-Session Valid (BSesVld)																														
					Indicates the Device mode transceiver status. In OTG mode, you can use this bit to determine if the device is connected or disconnected. Note: - If you do not enable OTG features (such as SRP and HNP), the read reset value will be 1.The vbus assigns the values internally for non- SRP or non-HNP configurations. - In case of OTG_MODE=0, the reset value of this bit is 1'b0. - The reset value of this register field can be read only after the PHY clock is stable, or if IDDIG_FILTER is enabled, wait for the filter timer to expire to read the correct reset value which ever event is later.																														
			NOTVALID	0	B-session is not valid.																														
	VALID	1	B-session is valid.																																
L	RW	OTGVER			OTG Version (OTGVer)																														
					Indicates the OTG revision.																														
			VER13	0	Supports OTG Version 1.3																														
	VER20	1	Supports OTG Version 2.0																																
M	R	CURMOD			Current Mode of Operation (CurMod)																														
					Mode: Host and Device Indicates the current mode. Reset: Note: The reset value of this register field can be read only after the PHY clock is stable, or if IDDIG_FILTER is enabled, wait for the filter timer to expire to read the correct reset value which ever event is later.																														
			DEVICEMODE	0	Current mode is device mode.																														
	HOSTMODE	1	Current mode is host mode.																																
N	R	MULTVALIDBC			Mode: Host and Device. Multi Valued ID pin (MultValidBC)																														
					Battery Charger ACA inputs in the following order:																														
			RIDC	1	B-Device connected to ACA. VBUS is on.																														
			RIDB	2	B-Device connected to ACA. VBUS is off.																														
			RIDA	4	A-Device connected to ACA																														
			RIDGND	8	A-Device not connected to ACA																														
RIDFLOAT	16	B-Device not connected to ACA

ID	R/W	Field	Value ID	Value	Description																														
C	RW	HSTNEGSUCSTSCHNG			Mode: Host and Device. Host Negotiation Success Status Change (HstNegSucStsChng)																														
					The core sets this bit on the success or failure of a USB host negotiation request. The application must read the Host Negotiation Success bit of the OTG Control and Status register (GOTGCTL.HstNegScs) to check for success or failure. This bit can be set only by the core and the application must write 1 to clear it.																														
			INACTIVE	0	No Change																														
			ACTIVE	1	Host Negotiation Status Change																														
D	RW	HSTNEGDET			Mode:Host and Device. Host Negotiation Detected (HstNegDet)																														
					The core sets this bit when it detects a host negotiation request on the USB. This bit can be set only by the core and the application must write 1 to clear it.																														
			INACTIVE	0	No Active HNP Request																														
			ACTIVE	1	Active HNP request detected																														
E	RW	ADEVTOUTCHG			Mode: Host and Device. A-Device Timeout Change (ADevTOUTChg)																														
					The core sets this bit to indicate that the A-device has timed out while waiting for the B-device to connect.This bit can be set only by the core and the application must write 1 to clear it.																														
			INACTIVE	0	No A-Device Timeout																														
			ACTIVE	1	A-Device Timeout																														
F	RW	DBNCDONE			Mode: Host only. Debounce Done (DbnceDone)																														
					The core sets this bit when the debounce is completed after the device connect. The application can start driving USB reset after seeing this interrupt. This bit is only valid when the HNP Capable or SRP Capable bit is SET in the Core USB Configuration register (GUSBCFG.HNPCap or GUSBCFG.SRPCap, respectively). This bit can be set only by the core and the application must write 1 to clear it.																														
			INACTIVE	0	After Connect waiting for Debounce to complete																														
			ACTIVE	1	Debounce completed																														
G	RW	MULTVALIPCHNG			This bit when set indicates that there is a change in the value of at least one ACA pin value.																														
					This bit is present only if OTG_BC_SUPPORT=1, otherwise it is reserved.																														
			NOACAPINCHANGE	0	Indicates there is no change in ACA pin value																														
			ACAPINCHANGE	1	Indicates there is a change in ACA pin value																														

8.27.5.3 GAHBCFG

Address offset: 0x008

AHB Configuration Register

This register can be used to configure the core after power-on or a change in mode. This register mainly contains AHB system-related configuration parameters. Do not change this register after the initial programming. The application must program this register before starting any transactions on either the AHB or the USB.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				J J I I H G F																E D C B B B B A

ID	R/W	Field	Value ID	Value	Description																														
A	RW	GLBLINTRMSK			Mode: Host and device. Global Interrupt Mask (GlbIntrMsk)																														
					The application uses this bit to mask or unmask the interrupt line assertion to itself. Irrespective of this bit's setting, the interrupt status registers are updated by the controller.																														
			MASK	0	Mask the interrupt assertion to the application																														
			NOMASK	1	Unmask the interrupt assertion to the application.																														
B	RW	HBSSTLEN			Mode: Host and device. Burst Length/Type (HBstLen)																														
					This field is used in both External and Internal DMA modes. In External DMA mode, these bits appear on dma_burst[3:0] ports, which can be used by an external wrapper to interface the External DMA Controller interface to Synopsys DW_ahb_dmac or ARM PrimeCell. External DMA Mode defines the DMA burst length in terms of 32-bit words: Internal DMA Mode AHB Requester burst type:																														
			WORD1ORSINGLE	0	1 word or single																														
			WORD4ORINCR	1	4 words or INCR																														
			WORD8	2	8 words																														
			WORD16ORINCR4	3	16 words or INCR4																														
			WORD32	4	32 words																														
			WORD64ORINCR8	5	64 words or INCR8																														
			WORD128	6	128 words																														
			WORD256ORINCR16	7	256 words or INCR16																														
WORDX	8	Others reserved																																	
C	RW	DMAEN			Mode: Host and device. DMA Enable (DMAEn)																														
					This bit is always 0 when Completer-Only mode has been selected.																														
			COMPLETERM	0	Core operates in Completer mode																														
		DMAMODE	1	Core operates in a DMA mode																															
D	RW	NPTXFEMPLVL			Mode: Host and device. Non-Periodic Tx FIFO Empty Level (NPTxFEmpLvl)																														
					This bit is used only in Completer mode. In host mode and with Shared FIFO with device mode, this bit indicates when the Non-Periodic Tx FIFO Empty Interrupt bit in the Core Interrupt register (GINTSTS.NPTxFEmp) is triggered. With dedicated FIFO in device mode, this bit indicates when IN endpoint Transmit FIFO empty interrupt (DIEPINTn.TxFEmp) is triggered. Host mode and with Shared FIFO with device mode: Dedicated FIFO in device mode: DIEPINTn.TxFEmp interrupt indicates that the Non-Periodic Tx FIFO is half empty or that the IN Endpoint Tx FIFO is half empty.																														
			HALFEMPTY	0																															
		EMPTY	1	GINTSTS.NPTxFEmp interrupt indicates that the Non-Periodic Tx FIFO is completely empty or that the IN Endpoint Tx FIFO is completely empty.																															
E	RW	PTXFEMPLVL			Mode: Host only. Periodic Tx FIFO Empty Level (PTxFEmpLvl)																														
					Indicates when the Periodic Tx FIFO Empty Interrupt bit in the Core Interrupt register (GINTSTS.PTxFEmp) is triggered. This bit is used only in Completer mode.																														
			HALFEMPTY	0	GINTSTS.PTxFEmp interrupt indicates that the Periodic Tx FIFO is half empty.																														
		EMPTY	1	GINTSTS.PTxFEmp interrupt indicates that the Periodic Tx FIFO is completely empty.																															

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																														
F	RW	REMMEMSUPP			Mode: Host and Device. Remote Memory Support (RemMemSupp)																														
					This bit is programmed to enable the functionality to wait for the system DMA Done Signal for the DMA Write Transfers. - GAHBCFG.RemMemSupp=1 The int_dma_req output signal is asserted when the DMA starts write transfer to the external memory. When the core is done with the Transfers it asserts int_dma_done signal to flag the completion of DMA writes from the controller. The core then waits for sys_dma_done signal from the system to proceed further and complete the Data Transfer corresponding to a particular Channel/Endpoint. - GAHBCFG.RemMemSupp=0 The int_dma_req and int_dma_done signals are not asserted and the core proceeds with the assertion of the XferComp interrupt as soon as the DMA write transfer is done at the Core Boundary and it does not wait for the sys_dma_done signal to complete the DATA transfers.																														
			DISABLED	0	Remote Memory Support Feature disabled																														
			ENABLED	1	Remote Memory Support Feature enabled																														
G	RW	NOTIALLDMAWRIT			Mode: Host and Device. Notify All DMA Write Transactions (NotiAllDmaWrit)																														
					This bit is programmed to enable the System DMA Done functionality for all the DMA write Transactions corresponding to the Channel/Endpoint. This bit is valid only when GAHBCFG.RemMemSupp is set to 1. - GAHBCFG.NotiAllDmaWrit = 1 The core asserts int_dma_req for all the DMA write transactions on the AHB interface along with int_dma_done, chep_last_transact and chep_number signal informations. The core waits for sys_dma_done signal for all the DMA write transactions in order to complete the transfer of a particular Channel/Endpoint. - GAHBCFG.NotiAllDmaWrit = 0 The core asserts int_dma_req signal only for the last transaction of DMA write transfer corresponding to a particular Channel/Endpoint. Similarly, the core waits for sys_dma_done signal only for that transaction of DMA write to complete the transfer of a particular Channel/Endpoint.																														
			LASTTRANS	0																															
			ALLTRANS	1	The core asserts int_dma_req for all the DMA write transactions on the AHB interface along with int_dma_done, chep_last_transact and chep_number signal informations. The core waits for sys_dma_done signal for all the DMA write transactions in order to complete the transfer of a particular Channel/Endpoint																														
H	RW	AHBSINGLE			Mode: Host and Device. AHB Single Support (AHBSingle)																														
					This bit when programmed supports Single transfers for the remaining data in a transfer when the core is operating in DMA mode. Note: If this feature is enabled, the AHB RETRY and SPLIT transfers still have INCR burst type. Enable this feature when the AHB Completer connected to the core does not support INCR burst (and when Split, and Retry transactions are not being used in the bus).																														
			INCRBURST	0	The remaining data in the transfer is sent using INCR burst size																														
			SINGLEBURST	1	The remaining data in the transfer is sent using Single burst size

Address offset: 0x00C

USB Configuration Register

This register can be used to configure the core after power-on or when changing to Host mode or Device mode. It contains USB and USB-PHY related configuration parameters. The application must program this register before starting any transactions on either the AHB or the USB. If you are using the HSIC interface, HSIC PHY must be in reset while programming this register. Do not make changes to this register after the initial programming.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
A	RW	TOUTCAL			Mode: Host and Device. HS/FS Timeout Calibration (TOutCal)																													
					The number of PHY clocks that the application programs in this field is added to the high-speed/full-speed interpacket timeout duration in the core to account for any additional delays introduced by the PHY. This can be required, because the delay introduced by the PHY in generating the linestate condition can vary from one PHY to another. The USB standard timeout value for high-speed operation is 736 to 816 (inclusive) bit times. The USB standard timeout value for full-speed operation is 16 to 18 (inclusive) bit times. The application must program this field based on the speed of enumeration. The number of bit times added per PHY clock are as follows: High-speed operation: - One 30-MHz PHY clock = 16 bit times - One 60-MHz PHY clock = 8 bit times Full-speed operation: - One 30-MHz PHY clock = 0.4 bit times - One 60-MHz PHY clock = 0.2 bit times - One 48-MHz PHY clock = 0.25 bit times																													
			ZERO	0	Add 0 PHY clocks

			SEVEN	7	Add 7 PHY clocks																														
B	RW	PHYIF			Mode: Host and Device. PHY Interface (PHYIf) The application uses this bit to configure the core to support a UTMI+ PHY with an 8- or 16-bit interface. When a ULPI PHY is chosen, this must be Set to 8-bit mode. This bit is writable only If UTMI+ and ULPI were selected. Otherwise, this bit returns the value for the power-on interface selected during configuration.																														
			BITS8	0	PHY 8bit Mode																														
			BITS16	1	PHY 16bit Mode																														
C	R	ULPIUTMISEL			Mode: Host and Device. ULPI or UTMI+ Select (ULPI_UTMI_Sel) The application uses this bit to select either a UTMI+ interface or ULPI Interface.																														
			UTMI	0	UTMI+ Interface																														
			ULPI	1	ULPI Interface																														
D	R	FSINTF			Mode: Host and Device. Full-Speed Serial Interface Select (FSIntf) The application uses this bit to select either a unidirectional or bidirectional USB 1.1 full-speed serial transceiver interface. If a USB 1.1 Full-Speed Serial Transceiver interface was not selected, this bit is always 0, with Write Only access. If a USB 1.1 FS interface was selected, Then the application can Set this bit to select between the 3- and 6-pin interfaces, and access is Read and Write. Note: For supporting the new 4-pin bi-directional interface, you need to select 6-pin unidirectional FS serial mode, and add an external control to convert it to a 4-pin interface.																														
			FS6PIN	0	6-pin unidirectional full-speed serial interface																														
			FS3PIN	1	3-pin bidirectional full-speed serial interface																														
E	R	PHYSEL			PHYSel Mode: Host and Device USB 2.0 High-Speed PHY or USB 1.1 Full-Speed Serial Transceiver Select (PHYSel) The application uses this bit to select either a high-speed UTMI+ or ULPI PHY, or a full-speed transceiver. If a USB 1.1 Full-Speed Serial Transceiver interface was not selected in, this bit is always 0, with Write Only access. If a high-speed PHY interface was not selected in, this bit is always 1, with Write Only access. If both interface types were selected (parameters have non-zero values), the application uses this bit to select which interface is active, and access is Read and Write.																														
			USB20	0	USB 2.0 high-speed UTMI+ or ULPI PHY is selected																														
			USB11	1	USB 1.1 full-speed serial transceiver is selected

ID	R/W	Field	Value ID	Value	Description																														
F	RW	USBTDRDTIM			Mode: Device only. USB Turnaround Time (USBTrdTim)																														
					Sets the turnaround time in PHY clocks. Specifies the response time for a MAC request to the Packet FIFO Controller (PFC) to fetch data from the DFIFO (SPRAM). This must be programmed to Note:Refer to Programming Guide Section "Choosing the Value of GUSBCFG.USBTrdTim" for the turnaround time calculation. During the AHB Clock Frequency selection, it is recommended to consider mis-sampling into account for USBTrdTim. USB turnaround time is critical for certification where long cables and 5-Hubs are used. If you need the AHB to run at less than 30 MHz (or less than 42MHz when operating in 16-bit UTMI mode in HS speed), and if USB turnaround time is not critical, these bits can be programmed to a larger value.																														
			TURNTIME16BIT	5	MAC interface is 16-bit UTMI+.																														
			TURNTIME8BIT	9	MAC interface is 8-bit UTMI+.																														
G	RW	PHYLPWRCLKSEL			PHY Low-Power Clock Select (PhyLPwrClkSel)																														
					Mode: Host and Device Selects either 480-MHz or 48-MHz (low-power) PHY mode. In FS and LS modes, the PHY can usually operate on a 48-MHz clock to save power. In 480 MHz mode, the UTMI interface operates at either 60 or 30-MHz, depending upon whether 8- or 16-bit data width is selected. In 48-MHz mode, the UTMI interface operates at 48 MHz in FS mode and at either 48 or 6 MHz in LS mode (depending on the PHY vendor). This bit drives the utmi_fsls_low_power core output signal, and is valid only for UTMI+ PHYs.																														
			INTPLLCLK	0	480-MHz Internal PLL clock																														
			EXTCLK	1	48-MHz External Clock																														
H	RW	TERMSELDPULSE			Mode: Device only. TermSel DLine Pulsing Selection (TermSelDLPulse)																														
					This bit selects utmi_termselect to drive data line pulse during SRP.																														
			TXVALID	0	Data line pulsing using utmi_txvalid																														
			TERMSEL	1	Data line pulsing using utmi_termsel																														
I	R	ICUSBCAP			Mode: Host and Device. IC_USB-Capable (IC_USBCap)																														
					The application uses this bit to control the core's IC_USB capabilities. This bit is writable only if OTG_ENABLE_IC_USB=1 and OTG_FSPHY_INTERFACE!=0. The reset value depends on the configuration parameter OTG_SELECT_IC_USB when OTG_ENABLE_IC_USB = 1. In all other cases, this bit is set to 1'b0 and the bit is read only.																														
			NOTSELECTED	0	IC_USB PHY Interface is not selected																														
			SELECTED	1	IC_USB PHY Interface is selected																														
J	RW	TXENDDelay			Mode: Device only. Tx End Delay (TxEndDelay)																														
					Setting this bit to 1'b1 enables the controller to follow the TxEndDelay timings as per UTMI+ specification 1.05 section 4.1.5 for opmode signal during remote wakeup. The default value of this field is 1'b1 and it is not recommended to program it to 1'b0. The option to set it to 1'b0 (Normal Mode) is present only for debug purpose.																														
			DISABLED	0	Normal Mode																														
			ENABLED	1	Tx End delay

K	RW	FORCEHSTMODE			Mode: Host and device. Force Host Mode (ForceHstMode)																														
					Writing a 1 to this bit forces the core to host mode irrespective of utmiotg_iddig input pin. After setting the force bit, the application must wait at least 25 ms before the change to take effect. When the simulation is in scale down mode, waiting for 500 micro sec is sufficient. This bit is valid only when OTG_MODE = 0, 1 or 2. In all other cases, this bit reads 0.																														
			DISABLED	0	Normal Mode																														
			ENABLED	1	Force Host Mode																														
L	RW	FORCEDEVMODE			Mode:Host and device. Force Device Mode (ForceDevMode)																														
					Writing a 1 to this bit forces the controller to device mode irrespective of utmiotg_iddig input pin. After setting the force bit, the application must wait at least 25 ms before the change to take effect. When the simulation is in scale down mode, waiting for 500 micro sec is sufficient. This bit is valid only when OTG_MODE = 0, 1 or 2. In all other cases, this bit reads 0.																														
			DISABLED	0	Normal Mode																														
			ENABLED	1	Force Device Mode																														
M	W	CORRUPTTXPKT			Mode: Host and device. Corrupt Tx packet (CorruptTxPkt)																														
					This bit is for debug purposes only. Never Set this bit to 1. The application must always write 1'b0 to this bit.																														
			Disabled	0	Normal Mode																														
			Enabled	1	Debug Mode																														

8.27.5.5 GRSTCTL

Address offset: 0x010

Reset Register

The application uses this register to reset various hardware features inside the controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			J I H																G G G F F F F E D C B A															
Reset 0x80000000			1 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	CSFTRST			Mode: Host and Device. Core Soft Reset (CSftRst)																													
					Resets the hclk and phy_clock domains as follows: - Clears the interrupts and all the CSR registers except the following register bits: -- PCGCCTL.RstPdwModule -- PCGCCTL.GateHclk -- PCGCCTL.PwrClmp -- PCGCCTL.StopPPhyLPwrClkSelclk -- GUSBCFG.ForceDevMode -- GUSBCFG.ForceHstMode -- GUSBCFG.PhyLPwrClkSel -- GUSBCFG.DDRSel -- GUSBCFG.PHYSel -- GUSBCFG.FSIntf -- GUSBCFG.ULPI_UTMI_Sel -- GUSBCFG.PHYIf -- GUSBCFG.TxEndDelay -- GUSBCFG.TermSelDLPulse -- GUSBCFG.ULPICKSusM -- GUSBCFG.ULPIAutoRes -- GUSBCFG.ULPIFsLs -- GGPIO -- GPWRDN -- GADPCTL -- HCFG.FLSPlkSel -- DCFG.DevSpd -- DCTL.SftDiscon - All module state machines - All module state machines (except the AHB Completer Unit) are reset to the IDLE state, and all the transmit FIFOs and the receive FIFO are flushed. - Any transactions on the AHB Requester are terminated as soon as possible, after gracefully completing the last data phase of an AHB transfer. Any transactions on the USB are terminated immediately. - When Hibernation or ADP feature is enabled, the PMU module is not reset by the Core Soft Reset. The application can write to this bit any time it wants to reset the core. The application must clear this bit after checking the bit 29 of this register (Core Soft Reset Done). Software must also must check that bit 31 of this register is 1 (AHB Requester is IDLE) before starting any operation. Typically software reset is used during software development and also when you dynamically change the PHY selection bits in the USB configuration registers listed above. When you change the PHY, the corresponding clock for the PHY is selected and used in the PHY domain. Once a new clock is selected, the PHY domain has to be reset for proper operation.																													
			NOTACTIVE	0	No reset																													
			ACTIVE	1	Resets hclk and phy_clock domains																													
B	RW	PIUFSSFTRST			Mode: Host and Device. PIU FS Dedicated Controller Soft Reset (PIUFSSftRst)																													
					Resets the PIU FS Dedicated Controller All module state machines in FS Dedicated Controller of PIU are reset to the IDLE state. Used to reset the FS Dedicated controller in PIU in case of any PHY Errors like Loss of activity or Babble Error resulting in the PHY remaining in RX state for more than one frame boundary. This is a self clearing bit and core clears this bit after all the necessary logic is reset in the core.																													
			RESETINACTIVE	0	No Reset																													
			RESETACTIVE	1	PIU FS Dedicated Controller Soft Reset																													
C	RW	FRMCNTRST			Mode: Host only. Host Frame Counter Reset (FrmCntrRst)																													
					The application writes this bit to reset the (micro)Frame number counter inside the core. When the (micro)Frame counter is reset, the subsequent SOF sent out by the core has a (micro)Frame number of 0. When application writes 1 to the bit, it might not be able to read back the value as it gets cleared by the core in a few clock cycles.																													
			NOTACTIVE	0	No reset																													
			ACTIVE	1	Host Frame Counter Reset																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value	ID	Value	Description																												
D	RW	RXFFLSH				Mode: Host and Device. RxFIFO Flush (RxFFlsh)																												
					The application can flush the entire RxFIFO using this bit, but must first ensure that the core is not in the middle of a transaction. The application must only write to this bit after checking that the controller is neither reading from the RxFIFO nor writing to the RxFIFO. The application must wait until the bit is cleared before performing any other operations. This bit requires eight clocks (slowest of PHY or AHB clock) to clear.																													
			INACTIVE	0	Does not flush the entire RxFIFO																													
		ACTIVE	1	Flushes the entire RxFIFO																														
E	RW	TXFFLSH				Mode: Host and Device. TxFIFO Flush (TxFFlsh)																												
					This bit selectively flushes a single or all transmit FIFOs, but cannot do so If the core is in the midst of a transaction. The application must write this bit only after checking that the core is neither writing to the TxFIFO nor reading from the TxFIFO. Verify using these registers: - ReadNAK Effective Interrupt ensures the core is not reading from the FIFO - WriteGRSTCTL.AHBIdle ensures the core is not writing anything to the FIFO. Flushing is normally recommended when FIFOs are reconfigured or when switching between Shared FIFO and Dedicated Transmit FIFO operation. FIFO flushing is also recommended during device endpoint disable. The application must wait until the core clears this bit before performing any operations. This bit takes eight clocks to clear, using the slower clock of phy_clk or hclk.																													
			INACTIVE	0	No Flush																													
		ACTIVE	1	Selectively flushes a single or all transmit FIFOs																														
F	RW	TXFNUM				Mode: Host and Device. TxFIFO Number (TxFNum)																												
					This is the FIFO number that must be flushed using the TxFIFO Flush bit. This field must not be changed until the core clears the TxFIFO Flush bit. -- Non-periodic TxFIFO flush in Host mode -- Non-periodic TxFIFO flush in device mode when in shared FIFO operation -- Tx FIFO 0 flush in device mode when in dedicated FIFO mode -- Periodic TxFIFO flush in Host mode -- Periodic TxFIFO 1 flush in Device mode when in shared FIFO operation -- TXFIFO 1 flush in device mode when in dedicated FIFO mode -- Periodic TxFIFO 2 flush in Device mode when in shared FIFO operation -- TXFIFO 2 flush in device mode when in dedicated FIFO mode ... -- Periodic TxFIFO 15 flush in Device mode when in shared FIFO operation -- TXFIFO 15 flush in device mode when in dedicated FIFO mode

8.27.5.6 GINTSTS

Address offset: 0x014

Interrupt STATUS Register

This register interrupts the application for system-level events in the current mode (Device mode or Host mode). Some of the bits in this register are valid only in Host mode, while others are valid in Device mode only. This register also indicates the current mode. To clear the interrupt status bits of type R_SS_WC, the application must write 1'b1 to the bit. The FIFO status interrupts are read only; once software reads from or writes to the FIFO while servicing these interrupts, FIFO interrupt conditions are cleared automatically. The application must clear the GINTSTS register at initialization before unmasking the interrupt bit to avoid any interrupts generated prior to initialization. Note: Read the reset value of GINTSTS.CurMod only after the following conditions: - If IDDIG_FILTER is disabled, read only after PHY clock is stable. - If IDDIG_FILTER is enabled, read only after the filter timer expires.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
A	R	CURMOD			Mode: Host and Device. Current Mode of Operation (CurMod)																													
					Indicates the current mode. Note: The reset value of this register field can be read only after the PHY clock is stable, or if IDDIG_FILTER is enabled, wait for the filter timer to expire to read the correct reset value which ever event is later.																													
			DEVICE	0	Device mode																													
			HOST	1	Host mode																													
B	RW	MODEMIS			Mode: Host and Device. Mode Mismatch Interrupt (ModeMis)																													
					The core sets this bit when the application is trying to access: - A Host mode register, when the controller is operating in Device mode - A Device mode register, when the controller is operating in Host mode The register access is completed on the AHB with an OKAY response, but is ignored by the controller internally and does not affect the operation of the controller. This bit can be set only by the core and the application must write 1 to clear it.																													
			INACTIVE	0	No Mode Mismatch Interrupt																													
			ACTIVE	1	Mode Mismatch Interrupt																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			d c b a Z Y X W V U T S R Q P O N M L K J I H G F E D C B A																															
Reset 0x04000020			0 0 0 0 0 1 0																															
ID	R/W	Field	Value ID	Value	Description																													
C	R	OTGINT			Mode: Host and Device. OTG Interrupt (OTGInt)																													
					The controller sets this bit to indicate an OTG protocol event. The application must read the OTG Interrupt Status (GOTGINT) register to determine the exact event that caused this interrupt. The application must clear the appropriate status bit in the GOTGINT register to clear this bit.																													
			INACTIVE	0	No Interrupt																													
			ACTIVE	1	OTG Interrupt																													
D	RW	SOF			Mode: Host and Device. Start of (micro)Frame (Sof)																													
					In Host mode, the core sets this bit to indicate that an SOF (FS), micro-SOF (HS), or Keep-Alive (LS) is transmitted on the USB. The application must write a 1 to this bit to clear the interrupt. In Device mode, the controller sets this bit to indicate that an SOF token has been received on the USB. The application can read the Device Status register to get the current (micro)Frame number. This interrupt is seen only when the core is operating at either HS or FS. This bit can be set only by the core and the application must write 1 to clear it. Note: This register may return 1'b1 if read immediately after power-on reset. If the register bit reads 1'b1 immediately after power-on reset, it does not indicate that an SOF has been sent (in case of host mode) or SOF has been received (in case of device mode). The read value of this interrupt is valid only after a valid connection between host and device is established. If the bit is set after power on reset the application can clear the bit.																													
			INACTIVE	0	No Start of Frame																													
			ACTIVE	1	Start of Frame																													
E	R	RXFLVL			Mode: Host and Device. RxFIFO Non-Empty (RxFlvl)																													
					Indicates that there is at least one packet pending to be read from the RxFIFO.																													
			INACTIVE	0	Rx Fifo is empty																													
		ACTIVE	1	Rx Fifo is not empty																														
F	R	NPTXFEMP			Mode: Host and Device. Non-periodic TxFIFO Empty (NPTxFEmp)																													
					This interrupt is asserted when the Non-periodic TxFIFO is either half or completely empty, and there is space for at least one Entry to be written to the Non-periodic Transmit Request Queue. The half or completely empty status is determined by the Non-periodic TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl). In host mode, the application can use GINTSTS.NPTxFEmp with the OTG_EN_DED_TX_FIFO parameter set to either 1 or 0. In device mode, the application uses GINTSTS.NPTxFEmp when OTG_EN_DED_TX_FIFO=0. When OTG_EN_DED_TX_FIFO=1, the application uses DIEPINTn.TxFEmp.																													
			INACTIVE	0	Non-periodic TxFIFO is not empty																													
			ACTIVE	1	Non-periodic TxFIFO is empty																													
G	R	GINNAKEFF			Mode: Device only. Global IN Non-periodic NAK Effective (GINNAKEff)																													
					Indicates that the Set Global Non-periodic IN NAK bit in the Device Control register (DCTL.SGNPInNak) set by the application, has taken effect in the core. That is, the core has sampled the Global IN NAK bit Set by the application. This bit can be cleared by clearing the Clear Global Non-periodic IN NAK bit in the Device Control register (DCTL.CGNPInNak). This interrupt does not necessarily mean that a NAK handshake is sent out on the USB. The STALL bit takes precedence over the NAK bit.																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
N	RW	EOPF			Mode: Device only. End of Periodic Frame Interrupt (EOPF)																													
					Indicates that the period specified in the Periodic Frame Interval field of the Device Configuration register (DCFG.PerFrInt) has been reached in the current microframe. In case of Non-Ignore Frame Number Scatter/Gather (Descriptor DMA) mode, the controller internally handles the following scenarios based on EOPF: Read Flush: At the EOPF, the controller checks if there are any pending packets in the FIFO corresponding to the current (micro)Frame. - If there are any pending packets, then the controller initiates read flush, due to which the read pointer is updated to the starting location of the next micro-frame packet. - If there are no pending packets corresponding to the current (micro)Frame, the controller does not take any action. Write Flush: At the EOPF, if the controller is still fetching the current micro-frame data, then the controller stops pushing data into the TXFIFO but keeps fetching the complete packet from the System Memory. After completing the scheduled packet size fetch, the controller updates the Status Quadlet Fields (Transmit Status to BUFFLUSH) and closes the Descriptor. During the descriptor close, the controller initiates write flush, due to which the write pointer is updated to the starting location of the next micro-frame packet. Because the controller stops pushing the packet to the TxFIFO after EOPF, to bring the write pointer to the starting location of the next micro-frame, write flush is done.																													
			INACTIVE	0	Not active																													
			ACTIVE	1	End of Periodic Frame Interrupt																													
O	RW	RSTRDONEINT			Mode: Device only. Restore Done Interrupt (RstrDoneInt)																													
					The controller sets this bit to indicate that the restore command after Hibernation was completed by the core. The controller continues from Suspended state into the mode dictated by PCGCCTL.RestoreMode field.																													
			INACTIVE	0	Not active																													
			ACTIVE	1	Restore Done Interrupt																													
P	RW	EPMIS			Mode: Device only. Endpoint Mismatch Interrupt (EPMis)																													
					Note: This interrupt is valid only in shared FIFO operation. Indicates that an IN token has been received for a non-periodic endpoint, but the data for another endpoint is present in the top of the Non-periodic Transmit FIFO and the IN endpoint mismatch count programmed by the application has expired.																													
			INACTIVE	0	Not active																													
			ACTIVE	1	Endpoint Mismatch Interrupt																													
Q	R	IEPINT			Mode: Device only. IN Endpoints Interrupt (IEPInt)																													
					The core sets this bit to indicate that an interrupt is pending on one of the IN endpoints of the core (in Device mode). The application must read the Device All Endpoints Interrupt (DAINT) register to determine the exact number of the IN endpoint on Device IN Endpoint-n Interrupt (DIEPINTn) register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the corresponding DIEPINTn register to clear this bit.																													
			INACTIVE	0	Not active																													
			ACTIVE	1	IN Endpoints Interrupt

ID	R/W	Field	Value ID	Value	Description																													
R	R	OEPINT			Mode: Device only. OUT Endpoints Interrupt (OEPInt)																													
					The controller sets this bit to indicate that an interrupt is pending on one of the OUT endpoints of the core (in Device mode). The application must read the Device All Endpoints Interrupt (DAINT) register to determine the exact number of the OUT endpoint on which the interrupt occurred, and then read the corresponding Device OUT Endpoint-n Interrupt (DOEPINTn) register to determine the exact cause of the interrupt. The application must clear the appropriate status bit in the corresponding DOEPINTn register to clear this bit.																													
			INACTIVE	0	Not active																													
			ACTIVE	1	OUT Endpoints Interrupt																													
S	RW	INCOMPSOIN			Mode: Device only. Incomplete Isochronous IN Transfer (incomplSOIN)																													
					The core sets this interrupt to indicate that there is at least one isochronous IN endpoint on which the transfer is not completed in the current microframe. This interrupt is asserted along with the End of Periodic Frame Interrupt (EOPF) bit in this register. Note: This interrupt is not asserted in Scatter/Gather DMA mode.																													
			INACTIVE	0	Not active																													
			ACTIVE	1	Incomplete Isochronous IN Transfer																													
T	RW	INCOMPLP			Incomplete Periodic Transfer (incomplP)																													
					Mode: Host only In Host mode, the core sets this interrupt bit when there are incomplete periodic transactions still pending which are scheduled for the current microframe. Incomplete Isochronous OUT Transfer (incomplSOOUT) Mode: Device only The Device mode, the core sets this interrupt to indicate that there is at least one isochronous OUT endpoint on which the transfer is not completed in the current microframe. This interrupt is asserted along with the End of Periodic Frame Interrupt (EOPF) bit in this register.																													
			INACTIVE	0	Not active																													
			ACTIVE	1	Incomplete Periodic Transfer																													
U	RW	FETSUSP			Mode: Device only. Data Fetch Suspended (FetSusp)																													
					This interrupt is valid only in DMA mode. This interrupt indicates that the core has stopped fetching data. For IN endpoints due to the unavailability of TxFIFO space or Request Queue space. This interrupt is used by the application for an endpoint mismatch algorithm. For example, after detecting an endpoint mismatch, the application: - Sets a Global non-periodic IN NAK handshake - Disables IN endpoints - Flushes the FIFO - Determines the token sequence from the IN Token Sequence Learning Queue - Re-enables the endpoints - Clears the Global non-periodic IN NAK handshake If the Global non-periodic IN NAK is cleared, the core has not yet fetched data for the IN endpoint, and the IN token is received. The core generates an 'IN token received when FIFO empty' interrupt. It then sends the host a NAK response. To avoid this scenario, the application can check the GINTSTS.FetSusp interrupt, which ensures that the FIFO is full before clearing a Global NAK handshake. Alternatively, the application can mask the IN token received when FIFO empty interrupt when clearing a Global IN NAK handshake.																													
			INACTIVE	0	Not active																													
			ACTIVE	1	Data Fetch Suspended																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Interrupt Mask Register

This register works with the Interrupt Register (GINTSTS) to interrupt the application. When an interrupt bit is masked, the interrupt associated with that bit is not generated. However, the GINTSTS register bit corresponding to that interrupt is still set. Note: The fields of this register change depending on host or device mode.

Receive Status Debug Read Register

A read to the Receive Status Debug Read register returns the contents of the top of the Receive FIFO. The receive status contents must be interpreted differently in Host and Device modes. The core ignores the receive status read when the receive FIFO is empty and returns a value of 32'h0000_0000. Note: - Use of these fields vary based on whether the core is functioning as a host or a device. - Do not read this register's reset value before configuring the core because the read value is 'X' in the simulation.

Receive Status Read/Pop Register

A read to the Receive Status Read and Pop register returns the contents of the top of the Receive FIFO and additionally pops the top data entry out of the RxFIFO. The receive status contents must be interpreted differently in Host and Device modes. The core ignores the receive status pop/read when the receive FIFO is empty and returns a value of 32'h0000_0000. The application must only pop the Receive Status FIFO when the Receive FIFO Non-Empty bit of the Core Interrupt register (GINTSTS.RxFLvl) is asserted. Note: - Use of these fields vary based on whether the core is functioning as a host or a device. - Do not read this register's reset value before configuring the core because the read value is 'X' in the simulation.

Address offset: 0x024

Receive FIFO Size Register

The application can program the RAM size that must be allocated to the RxFIFO.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0x00000C00				0 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW	RXFDEP			Mode: Host and Device. Rx FIFO Depth (RxFDEP) This value is in terms of 32-bit words. - Minimum value is 16 - Maximum value is 32,768 The power-on reset value of this register is specified as the Largest Rx Data FIFO Depth during configuration. If Enable Dynamic FIFO Sizing is selected in coreConsultant, these flops are optimized, and reads return the power-on value. If Enable Dynamic FIFO Sizing is selected in coreConsultant, you can write a new value in this field. Programmed values must not exceed the power-on value.																														

8.27.5.11 GNPTXFSIZ

Address offset: 0x028

Non-periodic Transmit FIFO Size Register

The application can program the RAM size and the memory start address for the Non-periodic TxFIFO

Note: The fields of this register change depending on host or device mode.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x3E10AA60			0 0 1 1 1 1 1 0 0 0 0 1 0 0 0 0 1 0 1 0 1 0 1 0 0 1 1 0 0 0 0																															
ID	R/W	Field	Value ID	Value	Description																													
			ENABLED	1	Service Interval Flow supported																													
H	R	IPGISOCSUPT			Interpacket Gap ISOC OUT Worst-case Support (ipgisocSupt)																													
					This bit indicates that the controller supports the worst-case scenario of Rx followed by Rx Inter Packet Gap (IPG) (32-bit times) as per the UTMI Specification for any token following an ISOC OUT token. Without this support, when any token follows an ISOC OUT token with the worst-case IPG, the controller does not detect the followed token. The worst-case IPG of the controller without this support depends on the AHB and PHY clock frequency.By default IPG Support is enabled.																													
			DISABLED	0	Interpacket Gap ISOC OUT Worst-case Support is Disabled																													
			ENABLED	1	Interpacket Gap ISOC OUT Worst-case Support is Enabled (Default)																													
I	R	ACGSUPT			Active Clock Gating Support																													
					This bit indicates that the controller supports the Dynamic (Switching) Power Reduction during periods when there is no USB and AHB Traffic.																													
			DISABLED	0																														
			ENABLED	1	Active Clock Gating Support																													
J	R	ENHANCEDLPMSUPT			Enhanced LPM Support (EnhancedLPMSupt)																													
					This bit indicates that the controller supports the following behavior: L1 Entry Behavior based on FIFO Status - TX FIFO - Accept L1 Request even if ISOC IN TX FIFO is not empty. - Reject L1 Request if Non-Periodic TX FIFO is not empty. - Ensure application can flush the TX FIFO while the Controller is in L1. - RX FIFO - Accept L1 Request even if RX FIFO (common to Periodic and Non-Periodic) is not empty. - Accept L1 Request but delay SLEEPM assertion until RX SINK Buffer is empty. Prevent L1 Entry if a Control Transfer is in progress on any Control Endpoint. Ability to Flush TxFIFO even if PHY Clock is gated.																													
			ENABLED	1	Enhanced LPM Support is enabled																													
K	R	PHYDATAWIDTH			UTMI+ PHY/ULPI-to-Internal UTMI+ Wrapper Data Width																													
					(PhyDataWidth)<vr>When a ULPI PHY is used, an internal wrapper converts ULPI to UTMI+.

LPM Config Register

Register to control the LPM functionality of the controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			O N M M M L K K K J J J J I H G G F F F F F E D C C C C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	LPMCAP			LPM-Capable (LPMCap)																													
					The application uses this bit to control the controller LPM capabilities.																													
					If the core operates as a non-LPM-capable host, it cannot request the connected device/hub to activate LPM mode. If the core operates as a non-LPM-capable device, it cannot respond to any LPM transactions. If GLPMCFG.LPMCap is 1'b0, the software must not set any of the remaining fields in the GLPMCFG register and these fields must hold their Reset values.																													
			DISABLED	0	LPM capability is not enabled																													
			ENABLED	1	LPM capability is enabled																													
B	RW	APPL1RES			Mode: Device only. LPM response programmed by application (Appl1Res)																													
					Handshake response to LPM token pre-programmed by device application software. The response depends on GLPMCFG.LPMCap. If GLPMCFG.LPMCap is 1'b0, the core operates as a non-LPM-capable Device and does not respond to any LPM transactions. If GLPMCFG.LPMCap is 1'b1, the core responds as follows: - 1: ACK Even though an ACK is pre-programmed, the core responds with an ACK only on a successful LPM transaction. The LPM transaction is successful if: -- There are no PID/CRC5 errors in both the EXT token and the LPM token (else ERROR) -- A valid bLinkState = 0001B (L1) is received in the LPM transaction (else STALL) -- No data is pending in the Transmit queue (else NYET) - 0: NYET The pre-programmed software bit is overridden for response to LPM token when: -- The received bLinkState is not L1 (STALL response) -- An error is detected in either of the LPM token packets due to corruption (ERROR response).																													
			NYETRESP	0	The core responds with a NYET when an error is detected in either of the LPM token packets due to corruption																													
			ACKRESP	1	The core responds with an ACK only on a successful LPM transaction

ID	R/W	Field	Value ID	Value	Description																																														
F	RW	HIRDTHRES			BESL/HIRD Threshold (HIRD_Thres) Device Mode: Note: When a ULPI/UTMI PHY associated with the controller (Host or device) does not support the LPM sleep feature clock gating, it is recommended to keep the HIRD_Thres[12] bit in disabled state (= 1'b0). This ensures the ULPI wrapper is in enabled mode and detects any wakeup events. - EnBESL = 1'b0: The core puts the PHY into deep low power mode in L1 (by core asserting L1SuspendM) when HIRD value is greater than or equal to the value defined in this field HIRD_Thres[3:0] and HIRD_Thres[4] is set to 1b1. - EnBESL = 1'b1: The core puts the PHY into deep low power mode in L1 (by core asserting L1SuspendM) when BESL value is greater than or equal to the value defined in this field BESL_Thres[3:0] and BESL_Thres [4] is set to 1'b1. - DCTL.DeepSleepBESLReject = 1'b1: In device initiated resume, the core expects the Host to resume service to the device within the BESL value corresponding to L1 exit time specified in HIRD_Thres[3:0]. The Device sends a NYET response when the received HIRD in LPM token is greater than HIRD threshold. Host Mode: The core puts the PHY into deep low power mode in L1 (by core asserting L1SuspendM) when HIRD_Thres[4] is set to 1'b1. HIRD_Thres[3:0] specifies the time for which resume signaling is to be reflected by host (TL1HubDrvResume2) on the USB bus when it detects device initiated resume. To differentiate between Deep Sleep and Shallow Sleep, HIRD greater than or equal to HIRD threshold comparison is done. For differentiating between NYET or ACK response for LPM token HIRD greater than HIRD Threshold comparison is used. - When EnBESL = 1'b0, HIRD_Thres must not be programmed with a value greater than 4'b1100 in host mode since this exceeds maximum TL1HubDrvResume2. - When EnBESL = 1'b1, HIRD_Thres must not be programmed with a value greater than 4'b0110 in host mode since this exceeds maximum TL1HubDrvResume2. For additional details, see the "Additional Details on GLPMCFG.HIRD_Thres Register Field" section in the databook.																																														
G	R	COREL1RES			LPM Response (CoreL1Res) Device Mode: The response of the core to LPM transaction received is reflected in these two bits. Host Mode: Handshake response received from local device for LPM transaction <table><tr><td>LPMRESP1</td><td>0</td><td>ERROR : No handshake response</td></tr><tr><td>LPMRESP2</td><td>1</td><td>STALL response</td></tr><tr><td>LPMRESP3</td><td>2</td><td>NYET response</td></tr><tr><td>LPMRESP4</td><td>3</td><td>ACK response</td></tr></table>																																			LPMRESP1	0	ERROR : No handshake response	LPMRESP2	1	STALL response	LPMRESP3	2	NYET response	LPMRESP4	3	ACK response

ID	R/W	Field	Value ID	Value	Description																													
H	R	SLPSTS			Port Sleep Status (SlpSts)																													
					Device Mode: This bit is set as long as a Sleep condition is present on the USB bus. The core enters the Sleep state when an ACK response is sent to an LPM transaction and the TL1TokenRetry timer has expired. To stop the PHY clock, the application must set the Port Clock Stop bit, which asserts the PHY Suspend input signal. The application must rely on SlpSts and not ACK in CoreL1Res to confirm transition into sleep. The core comes out of sleep: - When there is any activity on the USB line_state - When the application writes to the Remote Wakeup Signaling bit in the Device Control register (DCTL.RmtWkUpSig) or when the application resets or soft-disconnects the device. Host Mode: The host transitions to Sleep (L1) state as a side-effect of a successful LPM transaction by the core to the local port with ACK response from the device. The read value of this bit reflects the current Sleep status of the port. The core clears this bit after: - The core detects a remote L1 Wakeup signal; - The application sets the Port Reset bit or the Port L1Resume bit in the HPRT register; or - The application sets the L1Resume/ Remote Wakeup Detected Interrupt bit or Disconnect Detected Interrupt bit in the Core Interrupt register (GINTSTS.L1WkUpInt or GINTSTS.DisconnInt, respectively).																													
			CORENOTINL1	0	In Host or Device mode, this bit indicates core is not in L1																													
			COREINL1	1	In Host mode, this bit indicates the core transitions to Sleep state as a successful LPM transaction. In Device mode, the core enters the Sleep state when an ACK response is sent to an LPM transaction																													
I	R	L1RESUMEOK			Sleep State Resume OK (L1ResumeOK)																													
					Device and Host Mode: Indicates that the application or host can start resume from Sleep state. This bit is valid in LPM sleep (L1) state. It is set in sleep mode after a delay of 50 micro sec (TL1Residency). The bit is reset when SlpSts is 0.																													
			NOTOK	0	The application/core cannot start Resume from Sleep state																													
			OK	1	The application/core can start Resume from Sleep state																													
J	RW	LPMCHNLINDX			LPM Channel Index																													
					Host Mode: The channel number on which the LPM transaction has to be applied while sending an LPM transaction to the local device. Based on the LPM channel index, the core automatically inserts the device address and end point number programmed in the corresponding channel into the LPM transaction. Device Mode: LPM Accept Control (LPM_Accept_Ctrl) LPM_Accept_Ctrl[0] (LPM_Chnl_Indx[3]): The application can use this bit to accept an LPM token even if data is present in the INTR endpoint Tx FIFO. This bit is applicable only for Dedicated TX FIFO configurations (OTG_EN_DED_TX_FIFO=1).																													
			CH0	0	Channel 0																													
			CH1	1	Channel 1

K RW LPMRETRYCNT

LPM Retry Count (LPM_Retry_Cnt)

Host Mode: Number of additional LPM retries that the HOST would perform if the Device Response was an ERROR until a valid device response is received (STALL/NYET/ACK). Device Mode: LPM Accept Control (LPM_Accept_Ctrl) LPM_Accept_Ctrl[1]: The application can use this bit to reject an LPM token (NYET) between multiple stages of a single control transfer LPM_Accept_Ctrl[2]: The application can use this bit to accept an LPM token even if data is present in the ISOC endpoint Tx FIFO. This bit is applicable only for Dedicated Tx FIFO configurations (OTG_EN_DED_TX_FIFO=1). LPM_Accept_Ctrl[3]: The application can use this bit to accept an LPM token even if data is present in the BULK endpoint Tx FIFO. This bit is applicable only for Dedicated Tx FIFO configurations (OTG_EN_DED_TX_FIFO=1).

RETRY0	0	Zero LPM retries
RETRY1	1	One LPM retry
RETRY2	2	Two LPM retries
RETRY3	3	Three LPM retries
RETRY4	4	Four LPM retries
RETRY5	5	Five LPM retries
RETRY6	6	Six LPM retries
RETRY7	7	Seven LPM retries

L RW SNDLPM

Send LPM Transaction (SndLPM)

Host Mode: When set by application software, an LPM transaction containing two tokens, EXT & LPM is sent. Cleared by the hardware once a valid response (STALL/NYET/ACK) is received from the Device or the core had finished transmitting the programmed number of LPM retries. Note that this bit must be set only when the host is connected to local port.

DISABLED	0	In host-only mode: Received the response from the device for the LPM transaction
ENABLED	1	In host-only mode: Sending LPM transaction containing EXT and LPM tokens

M R LPMRETRYCNTSTS

LPM Retry Count Status (LPM_RetryCnt_Sts)

Host Mode: Number of LPM Host Retries still remaining to be transmitted for the current LPM sequence.

RETRYREM0	0	Zero LPM retries remaining
RETRYREM1	1	One LPM retry remaining
RETRYREM2	2	Two LPM retries remaining
RETRYREM3	3	Three LPM retries remaining
RETRYREM4	4	Four LPM retries remaining
RETRYREM5	5	Five LPM retries remaining
RETRYREM6	6	Six LPM retries remaining
RETRYREM7	7	Seven LPM retries remaining

N	RW	LPMENBESL			LPM Enable BESL (LPM_EnBESL)																														
					This bit enables the BESL feature as defined in LPM Errata																														
			DISABLED	0	BESL is disabled																														
			ENABLED	1	BESL is enabled as defined in LPM Errata																														
O	RW	LPMRESTORESLPSTS			LPM Restore Sleep Status (LPM_RestoreSlpSts)																														
					When the application power gates the core (Partial Power Down / Hibernation) the application needs to program this bit to restore the LPM status in the core. The application needs to program this bit, during restore process, based on whether it decides to go into Shallow Sleep (Clock Gating Only) or Deep Sleep (Power Gating) based on the BESL value received from the Host																														
			DISABLED	0	Puts the core in Shallow Sleep mode based on the BESL value from the Host																														
			ENABLED	1	Puts the core in Deep Sleep mode based on the BESL value from the Host																														

8.27.5.21 GPWRDN

Address offset: 0x058

Global Power Down Register

This is the Hibernation control register. This register is active only during hibernation and ADP. The application can get the status of the wakeup_logic and control it through this register.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Address offset: 0x068

Interrupt Mask Register 2

This register works with the Interrupt Register (GINTSTS2) to interrupt the application. When an interrupt bit is masked, the interrupt associated with that bit is not generated. However, the GINTSTS2 register bit corresponding to that interrupt is still set. Note: The fields of this register change depending on host or device mode.

Address offset: 0x06C

Interrupt Register 2

This register interrupts the application for system-level events in the current mode (Device mode or Host mode). Some of the bits in this register are valid only in Host mode, while others are valid in Device mode only. This register also indicates the current mode. To clear the interrupt status bits of type R_SS_WC, the application must write 1'b1 to the bit. The application must clear the GINTSTS2 register at initialization before unmasking the interrupt bit to avoid any interrupts generated prior to initialization.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

A	RW	PTXFSTADDR			Host Periodic TxFIFO Start Address (PTxFStAddr)																														
The power-on reset value of this register is the sum of the Largest Rx Data FIFO Depth and Largest Non-periodic Tx Data FIFO Depth. These parameters are: In shared FIFO operation: - OTG_RX_DFIFO_DEPTH + OTG_TX_NPERIO_DFIFO_DEPTH In dedicated FIFO mode: - OTG_RX_DFIFO_DEPTH + OTG_TX_HNPERIO_DFIFO_DEPTH If Enable Dynamic FIFO Sizing? was deselected in coreConsultant (parameter OTG_DFIFO_DYNAMICAL = 0), these flops are optimized, and reads return the power-on value. If Enable Dynamic FIFO Sizing? was selected in coreConsultant (parameter OTG_DFIFO_DYNAMICAL = 1), you can write a new value in this field. Programmed values must not exceed the power-on value set in coreConsultant.																																			
B	RW	PTXFSIZE			Host Periodic TxFIFO Depth (PTxFSize)																														
This value is in terms of 32-bit words. - Minimum value is 16 - Maximum value is 32,768 The power-on reset value of this register is specified as the Largest Host Mode Periodic Tx Data FIFO Depth. - If Enable Dynamic FIFO Sizing? was deselected in coreConsultant (parameter OTG_DFIFO_DYNAMICAL = 0), these flops are optimized, and reads return the power-on value. - If Enable Dynamic FIFO Sizing? was selected in coreConsultant (parameter OTG_DFIFO_DYNAMICAL = 1), you can write a new value in this field. Programmed values must not exceed the power-on value set in coreConsultant.																																			

8.27.5.26 DIEPTXF[n] (n=1..15)

Address offset: 0x104 + (n × 0x4)

Device IN Endpoint Transmit FIFO 1 Size Register

This register is valid only in dedicated FIFO mode (`OTG_EN_DED_TX_FIFO=1`). It holds the size and memory start address of IN endpoint TxFIFOs implemented in Device mode. Each FIFO holds the data for one IN endpoint. This register is repeated for instantiated IN endpoint FIFOs 1 to 15. For IN endpoint FIFO 0, use `GNPTXFSIZ` register for programming the size and memory start address.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x0C001800			0 0 0 0 1 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 1 0 0 0 0 0 0 0 0 0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	INEPNTXFSTADDR			IN Endpoint FIFO Transmit RAM Start Address (INEPnTxFStAddr)																													
					This field contains the memory start address for the IN endpoint Transmit FIFO that this register corresponds to. The power-on reset value of this register is calculated according to the following formula: $\text{OTG_RX_DFIFO_DEPTH} + \text{SUM of OTG_TX_DINEP_DFIFO_DEPTH_n'}$ where n = 0 to (FIFO number-1). For example, Start address of INEP FIFO 1 (DIEPTXF1) is OTG_RX_DFIFO_DEPTH + OTG_TX_DINEP_DFIFO_DEPTH_0, start address of INEP FIFO 2 (DIEPTXF2) is OTG_RX_DFIFO_DEPTH + OTG_TX_DINEP_DFIFO_DEPTH_0 + OTG_TX_DINEP_DFIFO_DEPTH_1, and so on. If at POR the calculated value (C) exceeds 65535, then the Reset value becomes Reset Value(A) = (C-65536). - If Enable Dynamic FIFO Sizing is deselected in coreConsultant (OTG_DFIFO_DYNAMIC = 0), this field is read-only and read value is the power-on reset value. - If Enable Dynamic FIFO Sizing is selected in coreConsultant (OTG_DFIFO_DYNAMIC = 1), and you have calculated or programmed a new value for RxFIFO depth or TX FIFO depths, you can program their values according to the above formula. Programmed values must not exceed the power-on value set in coreConsultant.																													
B	RW	INEPNTXFDEP			IN Endpoint Tx FIFO Depth (INEPnTxFDep)																													
					This value is in terms of 32-bit words. - Minimum value is 16 - Maximum value is 32,768 The power-on reset value of this register is specified as the Largest IN Endpoint FIFO number Depth (parameter OTG_TX_DINEP_DFIFO_DEPTH_i) set during coreConsultant configuration, where i is the FIFO number this register corresponds to. - If "Enable Dynamic FIFO Sizing?" was deselected in coreConsultant (parameter OTG_DFIFO_DYNAMIC = 0), these flops are optimized, and reads return the power-on value. - If "Enable Dynamic FIFO Sizing?" was selected in coreConsultant (parameter OTG_DFIFO_DYNAMIC = 1), you can write a new value in this field. Programmed values must not exceed the power-on value.

Address offset: 0x410

Host Periodic Transmit FIFO/Queue Status Register

8.27.5.31 HAIT

Host All Channels Interrupt Register

When a significant event occurs on a channel, the Host All Channels Interrupt register interrupts the application using the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt). This is shown in the "Interrupt Hierarchy" figure in the databook. There is one interrupt bit per channel, up to a maximum of 16 bits. Bits in this register are set and cleared when the application sets and clears bits in the corresponding Host Channel-n Interrupt register.

4539 001 v1.0

8.27.5.32 HAINTMSK

Address offset: 0x418

Host All Channels Interrupt Mask Register

The Host All Channel Interrupt Mask register works with the Host All Channel Interrupt register to interrupt the application when an event occurs on a channel. There is one interrupt mask bit per channel, up to a maximum of 16 bits.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

			UNMASK	1	UnMask Channel interrupt																														

8.27.5.33 HPRT

Address offset: 0x440

Host Port Control and Status Register

This register is available only in Host mode. Currently, the OTG Host supports only one port. A single register holds USB port-related information such as USB reset, enable, suspend, resume, connect status, and test mode for each port. It is shown in the "Interrupt Hierarchy" figure in the databook. The R_SS_WC bits in this register can trigger an interrupt to the application through the Host Port Interrupt bit of the Core Interrupt register (GINTSTS.PrtInt). On a Port Interrupt, the application must read this register and clear the bit that caused the interrupt. For the R_SS_WC bits, the application must write a 1 to the bit to clear the interrupt.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
C	RW	PRTENA			Port Enable (PrtEna)																													
					A port is enabled only by the core after a reset sequence, and is disabled by an overcurrent condition, a disconnect condition, or by the application clearing this bit. The application cannot Set this bit by a register write. It can only clear it to disable the port by writing 1. This bit does not trigger any interrupt to the application.																													
			DISABLED	0	Port disabled																													
			ENABLED	1	Port enabled																													
D	RW	PRTENCHNG			Port Enable/Disable Change (PrtEnChng)																													
					The core sets this bit when the status of the Port Enable bit [2] of this register changes.This bit can be set only by the core and the application must write 1 to clear it.																													
			INACTIVE	0	Port Enable bit 2 has not changed																													
			ACTIVE	1	Port Enable bit 2 changed																													
E	R	PRTOVRCURRACT			Port Overcurrent Active (PrtOvrCurrAct)																													
					Indicates the overcurrent condition of the port.																													
			INACTIVE	0	No overcurrent condition																													
			ACTIVE	1	Overcurrent condition																													
F	RW	PRTOVRCURRCHNG			Port Overcurrent Change (PrtOvrCurrChng)																													
					The core sets this bit when the status of the Port Overcurrent Active bit (bit 4) in this register changes.This bit can be set only by the core and the application must write 1 to clear it																													
			INACTIVE	0	Status of port overcurrent status is not changed																													
			ACTIVE	1	Status of port overcurrent changed																													
G	RW	PRTRES			Port Resume (PrtRes)																													
					The application sets this bit to drive resume signaling on the port. The core continues to drive the resume signal until the application clears this bit. If the core detects a USB remote wakeup sequence, as indicated by the Port Resume/Remote Wakeup Detected Interrupt bit of the Core Interrupt register (GINTSTS.WkUpInt), the core starts driving resume signaling without application intervention and clears this bit when it detects a disconnect condition. The read value of this bit indicates whether the core is currently driving resume signaling. When LPM is enabled, In L1 state the behavior of this bit is as follows: The application sets this bit to drive resume signaling on the port. The core continues to drive the resume signal until a pre-determined time specified in GLPMCFG.HIRD_Thres[3:0] field. If the core detects a USB remote wakeup sequence, as indicated by the Port L1Resume/Remote L1Wakeup Detected Interrupt bit of the Core Interrupt register (GINTSTS.L1WkUpInt), the core starts driving resume signaling without application intervention and clears this bit at the end of resume.This bit can be set by both core or application and also cleared by core or application. This bit is cleared by the core even if there is no device connected to the Host.																													
			NORESUME	0	No resume driven																													
			RESUME	1	Resume driven

H	RW	PRTSUSP			Port Suspend (PrtSusp)																													
					The application sets this bit to put this port in Suspend mode. The core only stops sending SOFs when this is Set. To stop the PHY clock, the application must Set the Port Clock Stop bit, which asserts the suspend input pin of the PHY. The read value of this bit reflects the current suspend status of the port. This bit is cleared by the core after a remote wakeup signal is detected or the application sets the Port Reset bit or Port Resume bit in this register or the Resume/Remote Wakeup Detected Interrupt bit or Disconnect Detected Interrupt bit in the Core Interrupt register (GINTSTS.WkUpInt or GINTSTS.DisconnInt, respectively).This bit is cleared by the core even if there is no device connected to the Host.																													
			INACTIVE	0	Port not in Suspend mode																													
			ACTIVE	1	Port in Suspend mode																													
I	RW	PRTRST			Port Reset (PrtRst)																													
					When the application sets this bit, a reset sequence is started on this port. The application must time the reset period and clear this bit after the reset sequence is complete. The application must leave this bit set for at least a minimum duration mentioned below to start a reset on the port. The application can leave it set for another 10 ms in addition to the required minimum duration, before clearing the bit, even though there is no maximum limit Set by the USB standard.This bit is cleared by the core even if there is no device connected to the Host. - High speed: 50 ms - Full speed/ Low speed: 10 ms																													
			DISABLED	0	Port not in reset																													
			ENABLED	1	Port in reset																													
J	R	PRTLNSTS			Port Line Status (PrtLnSts)																													
					Indicates the current logic level USB data lines																													
			PLUSD	1	Logic level of D+																													
		MINUSD	2	Logic level of D-																														
K	RW	PRTPWR			Port Power (PrtPwr)																													
					The application uses this field to control power to this port (write 1'b1 to set to 1'b1 and write 1'b0 to set to 1'b0), and the core can clear this bit on an over current condition. Note: This bit is interface independent. The application needs to program this bit for all interfaces as described in the host programming flow in the Programming Guide.																													
			OFF	0	Power off																													
		ON	1	Power on																														
L	RW	PRTTSTCTL			Port Test Control (PrtTstCtl)																													
					The application writes a nonzero value to this field to put the port into a Test mode, and the corresponding pattern is signaled on the port. To move the DWC_otg controller to test mode, you must set this field. Complete the following steps to move the DWC_otg core to test mode: - 1. Power on the core. - 2. Load the DWC_otg driver. - 3. Connect an HS device and enumerate to HS mode. - 4. Access the HPRT register to send test packets. - 5. Remove the device and connect to fixture (OPT) port. The DWC_otg host core continues sending out test packets. - 6. Test the eye diagram.																													
			DISABLED	0	Test mode disabled																													
			TESTJ	1	Test_J mode																													
			TESTK	2	Test_K mode

			DISABLED	0		Split not enabled																																																											
			ENABLED	1		Split enabled																																																											

8.27.5.36 HC[n].INT (n=0..15)

Address offset: 0x508 + (n × 0x18)

Host Channel Interrupt Register 0

This register indicates the status of a channel with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the Host Channels Interrupt bit of the Core Interrupt register (GINTSTS.HChInt) is set. Before the application can read this register, it must first read the Host All Channels Interrupt (HAINT) register to get the exact channel number for the Host Channel-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the HAINT and GINTSTS registers.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERCOMPL			Transfer Completed (XferCompl)																													
					Transfer completed normally without any errors.This bit can be set only by the core and the application must write 1 to clear it. - For Scatter/Gather DMA mode, it indicates that current descriptor processing got completed with IOC bit set in its descriptor. - In non Scatter/Gather DMA mode, it indicates that Transfer completed normally without any errors.																													
			INACTIVE	0	Transfer in progress or No Active Transfer																													
			ACTIVE	1	Transfer completed normally without any errors																													
B	RW	CHHLTD			Channel Halted (ChHltd)																													
					In non Scatter/Gather DMA mode, it indicates the transfer completed abnormally either because of any USB transaction error or in response to disable request by the application or because of a completed transfer. In Scatter/gather DMA mode, this indicates that transfer completed due to any of the following - EOL being set in descriptor - AHB error - Excessive transaction errors - Babble - Stall																													
			INACTIVE	0	Channel not halted																													
			ACTIVE	1	Channel Halted																													
C	RW	AHBERR			AHB Error (AHBErr)																													
					This is generated only in Internal DMA mode when there is an AHB error during AHB read/write. The application can read the corresponding channel's DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide.																													
			INACTIVE	0	No AHB error																													
			ACTIVE	1	AHB error during AHB read/write																													
D	RW	STALL			STALL Response Received Interrupt (STALL)																													
					In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core.This bit can be set only by the core and the application must write 1 to clear it.																													
			INACTIVE	0	No Stall Response Received Interrupt																													
			ACTIVE	1	Stall Response Received Interrupt																													
E	RW	NAK			NAK Response Received Interrupt (NAK)																													
					In Scatter/Gather DMA mode, the interrupt due to this bit is masked in the core.This bit can be set only by the core and the application must write 1 to clear it.																													
			INACTIVE	0	No NAK Response Received Interrupt																													
			ACTIVE	1	NAK Response Received Interrupt

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Non-Scatter/Gather DMA Mode: Transfer Size (XferSize) For an OUT, this field is the number of data bytes the host sends during the transfer. For an IN, this field is the buffer size that the application has Reserved for the transfer. The application is expected to program this field as an integer multiple of the maximum packet size for IN transactions (periodic and non-periodic). The width of this counter is specified as Width of Transfer Size Counters during coreConsultant configuration (parameter OTG_TRANS_COUNT_WIDTH). Scatter/Gather DMA Mode: [18:16]: Reserved [15:8]: NTD (Number of Transfer Descriptors) (Non Isochronous) This value is in terms of number of descriptors. Maximum number of descriptor that can be present in the list is 64. The values can be from 0 to 63. - 0: 1 descriptor - 63: 64 descriptors This field indicates the total number of descriptors present in that list. The core wraps around after servicing NTD number of descriptors for that list. (Isochronous) This field indicates the number of descriptors present in that list microframe. The possible values for FS are - 1: 2 descriptors - 3: 4 descriptors - 7: 8 descriptors - 15: 16 descriptors - 31: 32 descriptors - 63: 64 descriptors The possible values for HS are - 7: 8 descriptors - 15: 16 descriptors - 31: 32 descriptors - 63: 64 descriptors - 127: 128 descriptors - 255: 256 descriptors [7:0]: SCHED_INFO (Schedule information) Every bit in this 8 bit register indicates scheduling for that microframe. Bit 0 indicates scheduling for 1st microframe and bit 7 indicates scheduling for 8th microframe in that frame. A value of 8'b11111111 indicates that the corresponding interrupt channel is scheduled to issue a token every microframe in that frame. A value of 8'b10101010 indicates that the corresponding interrupt channel is scheduled to issue a token every alternate microframe starting with second microframe. Note that this field is applicable only for periodic (Isochronous and Interrupt) channels.																													
B	RW	PKTCNT			Non-Scatter/Gather DMA Mode: Packet Count (PktCnt) This field is programmed by the application with the expected number of packets to be transmitted (OUT) or received (IN). The host decrements this count on every successful transmission or reception of an OUT/IN packet. Once this count reaches zero, the application is interrupted to indicate normal completion. The width of this counter is specified as Width of Packet Counters during coreConsultant configuration (parameter OTG_PACKET_COUNT_WIDTH). Scatter/Gather DMA Mode: [28:19]: Reserved																													
C	RW	PID			PID (Pid) The application programs this field with the type of PID to use for the initial transaction. The host maintains this field for the rest of the transfer. <table><tr><td>DATA0</td><td>0</td><td>DATA0</td></tr><tr><td>DATA2</td><td>1</td><td>DATA2</td></tr><tr><td>DATA1</td><td>2</td><td>DATA1</td></tr><tr><td>MDATA</td><td>3</td><td>MDATA (non-control)/SETUP (control)</td></tr></table>	DATA0	0	DATA0	DATA2	1	DATA2	DATA1	2	DATA1	MDATA	3	MDATA (non-control)/SETUP (control)																	
DATA0	0	DATA0																																
DATA2	1	DATA2																																
DATA1	2	DATA1																																
MDATA	3	MDATA (non-control)/SETUP (control)																																
D	RW	DOPNG			Do Ping (DoPng) This bit is used only for OUT transfers. Setting this field to 1 directs the host to do PING protocol. Note: Do not set this bit for IN transfers. If this bit is set for IN transfers it disables the channel. <table><tr><td>NOPING</td><td>0</td><td>No ping protocol</td></tr></table>	NOPING	0	No ping protocol																										
NOPING	0	No ping protocol

ID	R/W	Field	Value ID	Value	Description																															
A	RW	DMAADDR			In Buffer DMA Mode:																															

[31:0]: DMA Address (DMAAddr) This field holds the start address in the external memory from which the data for the endpoint must be fetched or to which it must be stored. This register is incremented on every AHB transaction. Reset: X if not programmed as the register is in SPRAM. In Scatter-Gather DMA (DescDMA) Mode for Non-Isochronous: [31:9]: DMA Address (DMAAddr) The start address must be 512-bytes aligned. This field holds the start address of the 512 bytes page. The first descriptor in the list must be located in this address. The first descriptor may be or may not be ready. The core starts processing the list from the CTD value. [8:3]: Current Transfer Desc(CTD) This value is in terms of number of descriptors. The values can be from 0 to 63. This field indicates the current descriptor processed in the list. This field is updated both by application and the core. For example, if the application enables the channel after programming CTD=5, then the core starts processing the sixth descriptor. The address is obtained by adding a value of (8bytes*5=) 40(decimal) to DMAAddr. [2:0]: Reserved In Scatter-Gather DMA (DescDMA) Mode for Isochronous: [31:N]: DMA Address (DMAAddr) The start address must be 512-bytes aligned. This field holds the address of the 2*(nTD+1) bytes of locations in which the isochronous descriptors are present where N is based on nTD as follows: - [31:N]: Base Address - [N-1:3]: Offset - [2:0]: 000 For HS ISOC, if nTD is, - 7, N=6 - 15, N=7 - 31, N=8 - 63, N=9 - 127, N=10 - 255, N=11 For FS ISOC, if nTD is, - 1, N=4 - 3, N=5 - 7, N=6 - 15, N=7 - 31, N=8 - 63, N=9 [N-1:3]: Current Transfer Desc(CTD) CTD for isochronous is based on the current frame/(micro)frame value. Need to be set to zero by application. Reset: (N+1:3)'h0 [2:0]: Reserved

ID	R/W	Field	Value ID	Value	Description																														
A	RW	DEVSPD			Device Speed (DevSpd)																														
					Indicates the speed at which the application requires the core to enumerate, or the maximum speed the application can support. However, the actual bus speed is determined only after the connect sequence is completed, and is based on the speed of the USB host to which the core is connected.																														
			USBHS20	0	High speed USB 2.0 PHY clock is 30 MHz or 60 MHz																														
			USBFS20	1	Full speed USB 2.0 PHY clock is 30 MHz or 60 MHz																														
			USBL116	2	Low speed USB 1.1 transceiver clock is 6 MHz																														
		USBFS1148	3	Full speed USB 1.1 transceiver clock is 48 MHz																															
B	RW	NZSTSOUTSHK			Non-Zero-Length Status OUT Handshake (NZStsOUTSHk)																														
					The application can use this field to select the handshake the core sends on receiving a nonzero-length data packet during the OUT transaction of a control transfer's Status stage.																														
			SENDOUT	0	Send the received OUT packet to the application (zero-length or non-zero length) and send a handshake based on NAK and STALL bits for the endpoint in the Device Endpoint Control Register																														
		SENDSTALL	1	Send a STALL handshake on a nonzero-length status OUT transaction and do not send the received OUT packet to the application																															
C	RW	ENA32KHZSUSP			Enable 32 KHz Suspend mode (Ena32KHzSusp)																														
					This bit can be set only if FS PHY interface is selected. Otherwise, this bit needs to be set to zero. If FS PHY interface is chosen and this bit is set, the PHY clock during Suspend must be switched from 48 MHz to 32 KHz.																														
			DISABLED	0	USB 1.1 Full-Speed Serial Transceiver not selected																														
		ENABLED	1	USB 1.1 Full-Speed Serial Transceiver Interface selected																															
D	RW	DEVADDR			Device Address (DevAddr)																														
					The application must program this field after every SetAddress control command.																														
E	RW	PERFRINT			Periodic Frame Interval (PerFrInt)																														
					Indicates the time within a (micro)Frame at which the application must be notified using the End Of Periodic Frame Interrupt. This can be used to determine If all the isochronous traffic for that (micro)Frame is complete.																														
			EOPF80	0	80% of the (micro)Frame interval

Device All Endpoints Interrupt Register

When a significant event occurs on an endpoint, a Device All Endpoints Interrupt register interrupts the application using the Device OUT Endpoints Interrupt bit or Device IN Endpoints Interrupt bit of the Core Interrupt register (GINTSTS.OEPInt or GINTSTS.IEPInt, respectively). This is shown in Figure 5-2. There is one interrupt bit per endpoint, up to a maximum of 16 bits for OUT endpoints and 16 bits for IN endpoints. For a bidirectional endpoint, the corresponding IN and OUT interrupt bits are used. Bits in this register are set and cleared when the application sets and clears bits in the corresponding Device Endpoint-n Interrupt register (DIEPINTn/DOEPINTn).

A	RW	DVBUSDIS						Device VBUS Discharge Time (DVBUSDis)																											
				Specifies the VBUS discharge time after VBUS pulsing during SRP. This value equals (VBUS discharge time in PHY clocks) / 1, 024. The value you use depends whether the PHY is operating at 30MHz (16-bit data width) or 60 MHz (8-bit data width). Depending on your VBUS load, this value can need adjustment.

ID	R/W	Field	Value ID	Value	Description												
C	RW	TXTHRLEN			Transmit Threshold Length (TxThrLen) This field specifies Transmit thresholding size in DWORDS. This also forms the MAC threshold and specifies the amount of data in bytes to be in the corresponding endpoint transmit FIFO, before the core can start transmit on the USB. The threshold length has to be at least eight DWORDS when the value of AHBThrRatio is 2'h00. In case the AHBThrRatio is non zero the application needs to ensure that the AHB Threshold value does not go below the recommended eight DWORD. This field controls both isochronous and non-isochronous IN endpoint thresholds. The recommended value for ThrLen is to be the same as the programmed AHB Burst Length (GAHBCFG.HBstLen). Note: - When OTG_ARCHITECTURE=0, the reset value of this register field is 0. - When OTG_ARCHITECTURE=2, the reset value of this register field is 8.												
D	RW	AHBTHRRATIO			AHB Threshold Ratio (AHBThrRatio) These bits define the ratio between the AHB threshold and the MAC threshold for the transmit path only. The AHB threshold always remains less than or equal to the USB threshold, because this does not increase overhead. Both the AHB and the MAC threshold must be DWORD-aligned. The application needs to program TxThrLen and the AHBThrRatio to make the AHB Threshold value DWORD aligned. If the AHB threshold value is not DWORD aligned, the core might not behave correctly. When programming the TxThrLen and AHBThrRatio, the application must ensure that the minimum AHB threshold value does not go below 8 DWORDS to meet the USB turnaround time requirements. <table><tr><td>THRESZERO</td><td>0</td><td>AHB threshold = MAC threshold</td></tr><tr><td>THRESONE</td><td>1</td><td>AHB threshold = MAC threshold /2</td></tr><tr><td>THRESTWO</td><td>2</td><td>AHB threshold = MAC threshold /4</td></tr><tr><td>THRESTHREE</td><td>3</td><td>AHB threshold = MAC threshold /8</td></tr></table>	THRESZERO	0	AHB threshold = MAC threshold	THRESONE	1	AHB threshold = MAC threshold /2	THRESTWO	2	AHB threshold = MAC threshold /4	THRESTHREE	3	AHB threshold = MAC threshold /8
THRESZERO	0	AHB threshold = MAC threshold															
THRESONE	1	AHB threshold = MAC threshold /2															
THRESTWO	2	AHB threshold = MAC threshold /4															
THRESTHREE	3	AHB threshold = MAC threshold /8															
E	RW	RXTHREN			Receive Threshold Enable (RxThrEn) When this bit is set, the core enables thresholding in the receive direction. Note: We recommends that you do not enable RxThrEn, because it may cause issues in the RxFIFO especially during error conditions such as RxError and Babble. <table><tr><td>DISABLED</td><td>0</td><td>Disable thresholding</td></tr><tr><td>ENABLED</td><td>1</td><td>Enable thresholding in the receive direction</td></tr></table>	DISABLED	0	Disable thresholding	ENABLED	1	Enable thresholding in the receive direction						
DISABLED	0	Disable thresholding															
ENABLED	1	Enable thresholding in the receive direction															
F	RW	RXTHRLEN			Receive Threshold Length (RxThrLen) This field specifies Receive thresholding size in DWORDS. This field also specifies the amount of data received on the USB before the core can start transmitting on the AHB. The threshold length has to be at least eight DWORDS. The recommended value for ThrLen is to be the same as the programmed AHB Burst Length (GAHBCFG.HBstLen).												
G	RW	ARBPRKEN			Arbiter Parking Enable (ArbPrkEn) This bit controls internal DMA arbiter parking for IN endpoints. If thresholding is enabled and this bit is set to one, then the arbiter parks on the IN endpoint for which there is a token received on the USB. This is done to avoid getting into underrun conditions. By default, arbiter parking is enabled. <table><tr><td>DISABLED</td><td>0</td><td>Disable DMA arbiter parking</td></tr><tr><td>ENABLED</td><td>1</td><td>Enable DMA arbiter parking for IN endpoints</td></tr></table>	DISABLED	0	Disable DMA arbiter parking	ENABLED	1	Enable DMA arbiter parking for IN endpoints						
DISABLED	0	Disable DMA arbiter parking															
ENABLED	1	Enable DMA arbiter parking for IN endpoints

ID	R/W	Field	Value ID	Value	Description																														
C	R	NAKSTS	ACTIVE0	1	Control endpoint is always active																														
					NAK Status (NAKSts)																														
					Indicates the following: When this bit is set, either by the application or core, the core stops transmitting data, even If there is data available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																														
			INACTIVE	0	The core is transmitting non-NAK handshakes based on the FIFO status																														
			ACTIVE	1	The core is transmitting NAK handshakes on this endpoint																														
D	R	EPTYPE			Endpoint Type (EPTYPE)																														
					Hardcoded to 00 for control.																														
			ACTIVE	0	Endpoint Control 0																														
E	RW	STALL			STALL Handshake (Stall)																														
					The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Nonperiodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority.																														
			INACTIVE	0	No Stall																														
			ACTIVE	1	Stall Handshake																														
F	RW	TXFNUM			TxFIFO Number (TxFNum)																														
					- For Shared FIFO operation, this value is always set to 0, indicating that control IN endpoint 0 data is always written in the Non-Periodic Transmit FIFO. - For Dedicated FIFO operation, this value is set to the FIFO number that is assigned to IN Endpoint.																														
			TXFIFO0	0	Tx FIFO 0

Device IN Endpoint 0 Interrupt Register

This register indicates the status of an endpoint with respect to USB- and AHB-related events. It is shown in the "Interrupt Hierarchy" figure in the databook. The application must read this register when the OUT Endpoints Interrupt bit or IN Endpoints Interrupt bit of the Core Interrupt register (GINTSTS.OEPInt or GINTSTS.IEPInt, respectively) is set. Before the application can read this register, it must first read the Device All Endpoints Interrupt (DAINT) register to get the exact endpoint number for the Device Endpoint-n Interrupt register. The application must clear the appropriate bit in this register to clear the corresponding bits in the DAINT and GINTSTS registers

Bit number					31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID	R/W	Field	Value ID	Value	Description																													
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																													
					This bit is valid only for IN Endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmplvl)).																													
			INACTIVE	0	No Transmit FIFO Empty interrupt																													
			ACTIVE	1	Transmit FIFO Empty interrupt																													
I	RW	TXFIFOUNDRN			Fifo Underrun (TxfifoUndrn)																													
					Applies to IN endpoints only. The core generates this interrupt when it detects a transmit FIFO underrun condition in threshold mode for this endpoint.																													
			INACTIVE	0	No Fifo Underrun interrupt																													
			ACTIVE	1	Fifo Underrun interrupt																													
J	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done.																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
K	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status																													
L	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	BbleErr interrupt																													
M	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	NAK Interrupt																													
N	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	NYET Interrupt

ID	R/W	Field	Value ID	Value	Description																														
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																														
			DATA0EVENFRM	0	DATA0 or Even Frame																														
			DATA1ODDFRM	1	DATA1 or Odd Frame																														
D	R	NAKSTS			NAK Status (NAKSts)																														
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																														
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																														
			NAK	1	The core is transmitting NAK handshakes on this endpoint																														
E	RW	EPTYPE			Endpoint Type (EPTType)																														
					This is the transfer type supported by this logical endpoint.																														
			CONTROL	0	Control																														
			ISOCHRONOUS	1	Isochronous																														
			BULK	2	Bulk																														
	INTERRUP	3	Interrupt																																
F	RW	STALL			STALL Handshake (Stall)																														
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																														
			INACTIVE	0	STALL All non-active tokens																														
			ACTIVE	1	STALL All Active Tokens

J	W	SETD0PID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr)																													
					- Applies to isochronous IN endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to Even (micro)Frame																													
K	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to Odd (micro)Frame																													
L	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
M	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint																													

Device IN Endpoint Interrupt Register 1

This register contains the interrupts for the IN Endpoint 1 of the Device controller. Note: This register exists for an endpoint *i* if the OTG_EP_DIR_1 parameter is 0 or 1 for that endpoint.

ID	R/W	Field	Value ID	Value	Description																													
F	RW	INTKNEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																													
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																													
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																													
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																													
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																													
			INACTIVE	0	No Endpoint NAK Effective interrupt																													
			ACTIVE	1	IN Endpoint NAK Effective interrupt																													
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																													
					This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)).																													
			INACTIVE	0	No Transmit FIFO Empty interrupt																													
			ACTIVE	1	Transmit FIFO Empty interrupt																													
I	RW	TXFIFOUNDRN			Fifo Underrun (TxfifoUndrn)																													
					Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint.																													
			INACTIVE	0	No Tx FIFO Underrun interrupt																													
			ACTIVE	1	TxFIFO Underrun interrupt																													
J	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done.																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
K	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
L	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	BbleErr interrupt

Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW	XFERSIZE			Transfer Size (XferSize)																														
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO.																														
B	RW	PKTCNT			Packet Count (PktCnt)																														
					Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO.																														
C	RW	MC			MC																														
					Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetch for an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp)																														
			PACKETONE	1	1 packet																														
			PACKETTWO	2	2 packets																														
			PACKETTHREE	3	3 packets

Reset 0x00000080			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
C	RW	AHBERR			AHB Error (AHBErr)																													
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	TIMEOUT			Timeout Condition (TimeOUT)																													
					- In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint.																													
			INACTIVE	0	No Timeout interrupt																													
			ACTIVE	1	Timeout interrupt																													
E	RW	INTKNTXFEMP			IN Token Received When TxFIFO is Empty (INTknTXFEmp)																													
					Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received interrupt																													
			ACTIVE	1	IN Token Received Interrupt																													
F	RW	INTKNEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																													
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																													
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																													
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																													
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																													
			INACTIVE	0	No Endpoint NAK Effective interrupt																													
			ACTIVE	1	IN Endpoint NAK Effective interrupt																													
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																													
					This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)).																													
			INACTIVE	0	No Transmit FIFO Empty interrupt																													
			ACTIVE	1	Transmit FIFO Empty interrupt

ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize) Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO.																													
B	RW	PKTCNT			Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO.																													
C	RW	MC			MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetch for an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp)																													
			PACKETONE	1	1 packet																													
			PACKETTWO	2	2 packets																													
			PACKETTHREE	3	3 packets

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			DATA0EVENFRM	0	DATA0 or Even Frame																													
			DATA1ODDFRM	1	DATA1 or Odd Frame																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
		NAK	1	The core is transmitting NAK handshakes on this endpoint																														
E	RW	EPTYPE			Endpoint Type (EPTType)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
		INTERRUP	3	Interrupt																														
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
		ACTIVE	1	STALL All Active Tokens

ID	R/W	Field	Value	ID	Value															Description														

ID	R/W	Field	Value ID	Value	Description
G	RW	TXFNUM			TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints.
			TXFIFO0	0	Tx FIFO 0
			TXFIFO1	1	Tx FIFO 1
			TXFIFO2	2	Tx FIFO 2
			TXFIFO3	3	Tx FIFO 3
			TXFIFO4	4	Tx FIFO 4

ID	R/W	Field	Value ID	Value	Description																														
A	RW	XFERSIZE			Transfer Size (XferSize) Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO.																														
B	RW	PKTCNT			Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO.																														
C	RW	MC			MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetch for an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp)																														
			PACKETONE	1	1 packet																														
			PACKETTWO	2	2 packets

ID	R/W	Field	Value ID	Value	Description																														
A	RW	MPS			Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.																														
B	RW	USBACTEP			USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.																														
			DISABLED	0	Not Active																														
			ENABLED	1	USB Active Endpoint																														
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																														
			DATA0EVENFRM	0	DATA0 or Even Frame																														
			DATA1ODDFRM	1	DATA1 or Odd Frame																														
D	R	NAKSTS			NAK Status (NAKSts) Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																														
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																														
			NAK	1	The core is transmitting NAK handshakes on this endpoint																														
E	RW	EPTYPE			Endpoint Type (EPTYPE) This is the transfer type supported by this logical endpoint.

K	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to Odd (micro)Frame																													
L	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
M	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint																													

Device IN Endpoint Interrupt Register 5

This register contains the interrupts for the IN Endpoint 5 of the Device controller. Note: This register exists for an endpoint *i* if the OTG_EP_DIR_ *i* parameter is 0 or 1 for that endpoint.

4539_001 v1.0

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
F	RW	INTKNEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																													
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																													
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																													
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																													
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																													
			INACTIVE	0	No Endpoint NAK Effective interrupt																													
			ACTIVE	1	IN Endpoint NAK Effective interrupt																													
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																													
					This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)).																													
			INACTIVE	0	No Transmit FIFO Empty interrupt																													
			ACTIVE	1	Transmit FIFO Empty interrupt																													
I	RW	TXFIFOUNDRN			Fifo Underrun (TxfifoUndrn)																													
					Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint.																													
			INACTIVE	0	No Tx FIFO Underrun interrupt																													
			ACTIVE	1	TxFIFO Underrun interrupt																													
J	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done.																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
K	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
L	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	BbleErr interrupt																													

8.27.5.78 DIEPTSIZ5

Device IN Endpoint Transfer Size Register 5

Register	Access	Field	Description
A	RW	XFERSIZE	Transfer Size (XferSize) Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO.
B	RW	PKTCNT	Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO.
C	RW	MC	MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetch for an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp)
		PACKETONE	1 1 packet
		PACKETTWO	2 2 packets
		PACKETTHREE	3 3 packets

Device Control IN Endpoint Control Register 6

This register is used to control the characteristics of Endpoint 6. Note: This register exists for an endpoint *i* if the OTG_EP_DIR_ *i* parameter is 0 or 1 for that endpoint.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			M L K J I H G G G G F E E D C B																A A A A A A A A A A A A A A A A															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	MPS			Maximum Packet Size (MPS)																													
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.																													
B	RW	USBACTEP			USB Active Endpoint (USBActEP)																													
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.																													
			DISABLED	0	Not Active																													
			ENABLED	1	USB Active Endpoint																													
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			DATA0EVENFRM	0	DATA0 or Even Frame																													
			DATA1ODDFRM	1	DATA1 or Odd Frame																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint																													
E	RW	EPTYPE			Endpoint Type (EPTYPE)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
			INTERRUPT	3	Interrupt																													

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
F	RW	STALL			STALL Handshake (Stall)																														
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																														
			INACTIVE	0	STALL All non-active tokens																														
			ACTIVE	1	STALL All Active Tokens																														
G	RW	TXFNUM			TxFIFO Number (TxFNum)																														
					Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints.																														
			TXFIFO0	0	Tx FIFO 0																														
			TXFIFO1	1	Tx FIFO 1																														
			TXFIFO2	2	Tx FIFO 2

C	RW	AHBERR			AHB Error (AHBErr)																													
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	TIMEOUT			Timeout Condition (TimeOUT)																													
					- In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint.																													
			INACTIVE	0	No Timeout interrupt																													
			ACTIVE	1	Timeout interrupt																													
E	RW	INTKNTXFEMP			IN Token Received When TxFIFO is Empty (INTknTXFEmp)																													
					Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received interrupt																													
			ACTIVE	1	IN Token Received Interrupt																													
F	RW	INTKNEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																													
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																													
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																													
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																													
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																													
			INACTIVE	0	No Endpoint NAK Effective interrupt

ID	R/W	Field	Value ID	Value	Description																													
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			DATA0EVENFRM	0	DATA0 or Even Frame																													
			DATA1ODDFRM	1	DATA1 or Odd Frame																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
		NAK	1	The core is transmitting NAK handshakes on this endpoint																														
E	RW	EPTYPE			Endpoint Type (EPTType)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
		INTERRUP	3	Interrupt																														
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
		ACTIVE	1	STALL All Active Tokens

J	W	SETD0PID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr)																													
					- Applies to isochronous IN endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to Even (micro)Frame																													
K	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to Odd (micro)Frame																													
L	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
M	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint																													

Device IN Endpoint Interrupt Register 7

This register contains the interrupts for the IN Endpoint 7 of the Device controller. Note: This register exists for an endpoint i if the OTG EP DIR i parameter is 0 or 1 for that endpoint.

Reset 0x00000080			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
F	RW	INTKNEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																													
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																													
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																													
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																													
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																													
			INACTIVE	0	No Endpoint NAK Effective interrupt																													
			ACTIVE	1	IN Endpoint NAK Effective interrupt																													
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																													
					This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)).																													
			INACTIVE	0	No Transmit FIFO Empty interrupt																													
			ACTIVE	1	Transmit FIFO Empty interrupt																													
I	RW	TXFIFOUNDRN			Fifo Underrun (TxfifoUndrn)																													
					Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint.																													
			INACTIVE	0	No Tx FIFO Underrun interrupt																													
			ACTIVE	1	TxFIFO Underrun interrupt																													
J	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done.																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
K	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
L	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	BbleErr interrupt

ID	R/W	Field	Value ID	Value	Description																														
A	RW	XFERSIZE			Transfer Size (XferSize)																														
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO.																														
B	RW	PKTCNT			Packet Count (PktCnt)																														
					Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO.																														
C	RW	MC			MC																														
					Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetch for an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp)																														
			PACKETONE	1	1 packet																														
			PACKETTWO	2	2 packets																														
			PACKETTHREE	3	3 packets

In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr)																													
					- Applies to isochronous IN endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even (micro)Frame																													
		ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to Even (micro)Frame																														
K	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd (micro)Frame																													
		ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to Odd (micro)Frame																														
L	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.

Reset 0x00000080					0 0																															
ID	R/W	Field	Value ID	Value	Description																															
C	RW	AHBERR			AHB Error (AHBErr)																															
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide.																															
			INACTIVE	0	No AHB Error Interrupt																															
			ACTIVE	1	AHB Error interrupt																															
D	RW	TIMEOUT			Timeout Condition (TimeOUT)																															
					- In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint.																															
			INACTIVE	0	No Timeout interrupt																															
			ACTIVE	1	Timeout interrupt																															
E	RW	INTKNTXFEMP			IN Token Received When TxFIFO is Empty (INTknTXFEmp)																															
					Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received.																															
			INACTIVE	0	No IN Token Received interrupt																															
			ACTIVE	1	IN Token Received Interrupt																															
F	RW	INTKNPEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																															
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																															
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																															
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																															
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																															
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																															
			INACTIVE	0	No Endpoint NAK Effective interrupt																															
			ACTIVE	1	IN Endpoint NAK Effective interrupt																															
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																															
					This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)).																															
			INACTIVE	0	No Transmit FIFO Empty interrupt																															
			ACTIVE	1	Transmit FIFO Empty interrupt

ID	R/W	Field	Value ID	Value	Description																														
I	RW	TXFIFOUNDRN			Fifo Underrun (TxfifoUndrn)																														
					Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint.																														
			INACTIVE	0	No Tx FIFO Underrun interrupt																														
			ACTIVE	1	TxFIFO Underrun interrupt																														
J	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																														
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done.																														
			INACTIVE	0	No BNA interrupt																														
			ACTIVE	1	BNA interrupt																														
K	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																														
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																														
			INACTIVE	0	No interrupt																														
			ACTIVE	1	Packet Drop Status interrupt																														
L	RW	BBLEERR			NAK Interrupt (BbleErr)																														
					The core generates this interrupt when babble is received for the endpoint.																														
			INACTIVE	0	No interrupt																														
			ACTIVE	1	BbleErr interrupt																														
M	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																														
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																														
			INACTIVE	0	No NAK interrupt																														
			ACTIVE	1	NAK Interrupt																														
N	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																														
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																														
			INACTIVE	0	No NYET interrupt																														
			ACTIVE	1	NYET Interrupt

ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize) Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO.																													
B	RW	PKTCNT			Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO.																													
C	RW	MC			MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetch for an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp)																													
			PACKETONE	1	1 packet																													
			PACKETTWO	2	2 packets																													
			PACKETTHREE	3	3 packets

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			DATA0EVENFRM	0	DATA0 or Even Frame																													
			DATA1ODDFRM	1	DATA1 or Odd Frame																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
		NAK	1	The core is transmitting NAK handshakes on this endpoint																														
E	RW	EPTYPE			Endpoint Type (EPTType)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
		INTERRUP	3	Interrupt																														
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
		ACTIVE	1	STALL All Active Tokens

ID	R/W	Field	Value	ID	Value				Description																											

ID	R/W	Field	Value ID	Value	Description
G	RW	TXFNUM			TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints.
			TXFIFO0	0	Tx FIFO 0
			TXFIFO1	1	Tx FIFO 1
			TXFIFO2	2	Tx FIFO 2

Reset 0x00000080			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
F	RW	INTKNEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																													
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																													
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																													
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																													
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																													
			INACTIVE	0	No Endpoint NAK Effective interrupt																													
			ACTIVE	1	IN Endpoint NAK Effective interrupt																													
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																													
					This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)).																													
			INACTIVE	0	No Transmit FIFO Empty interrupt																													
			ACTIVE	1	Transmit FIFO Empty interrupt																													
I	RW	TXFIFOUNDRN			Fifo Underrun (TxfifoUndrn)																													
					Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint.																													
			INACTIVE	0	No Tx FIFO Underrun interrupt																													
			ACTIVE	1	TxFIFO Underrun interrupt																													
J	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done.																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
K	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
L	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	BbleErr interrupt

ID	R/W	Field	Value ID	Value	Description																													
A	RW	MPS			Maximum Packet Size (MPS)																													
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.																													
B	RW	USBACTEP			USB Active Endpoint (USBActEP)																													
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.																													
			DISABLED	0	Not Active																													
			ENABLED	1	USB Active Endpoint																													
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			DATA0EVENFRM	0	DATA0 or Even Frame																													
			DATA1ODDFRM	1	DATA1 or Odd Frame																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint																													
E	RW	EPTYPE			Endpoint Type (EPTYPE)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous

C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			DATA0EVENFRM	0	DATA0 or Even Frame																													
			DATA1ODDFRM	1	DATA1 or Odd Frame																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint																													
E	RW	EPTYPE			Endpoint Type (EPTType)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
INTERRUP	3	Interrupt																																
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens

ID	R/W	Field	Value ID	Value	Description
G	RW	TXFNUM			TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints.
			TXFIFO0	0	Tx FIFO 0
			TXFIFO1	1	Tx FIFO 1
			TXFIFO2	2	Tx FIFO 2
			TXFIFO3	3	Tx FIFO 3
			TXFIFO4	4	Tx FIFO 4
			TXFIFO5	5	Tx FIFO 5
			TXFIFO6	6	Tx FIFO 6
			TXFIFO7	7	Tx FIFO 7
			TXFIFO8	8	Tx FIFO 8
			TXFIFO9	9	Tx FIFO 9
			TXFIFO10	10	Tx FIFO 10
			TXFIFO11	11	Tx FIFO 11
			TXFIFO12	12	Tx FIFO 12
			TXFIFO13	13	Tx FIFO 13
			TXFIFO14	14	Tx FIFO 14
			TXFIFO15	15	Tx FIFO 15
H	W	CNAK			Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint.
			INACTIVE	0	No Clear NAK
			ACTIVE	1	Clear NAK
I	W	SNACK			Set NAK (SNACK) A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also Set this bit for an endpoint after a SETUP packet is received on that endpoint.
			INACTIVE	0	No Set NAK
			ACTIVE	1	Set NAK

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
J	W	SETD0PID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr)																													
					- Applies to isochronous IN endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to Even (micro)Frame																													
K	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to Odd (micro)Frame																													
L	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
M	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	MPS			Maximum Packet Size (MPS)																													
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.																													
B	RW	USBACTEP			USB Active Endpoint (USBActEP)																													
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.																													
			DISABLED	0	Not Active																													
			ENABLED	1	USB Active Endpoint																													
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			DATA0EVENFRM	0	DATA0 or Even Frame																													
			DATA1ODDFRM	1	DATA1 or Odd Frame																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint																													
E	RW	EPTYPE			Endpoint Type (EPTYPE)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk

Device IN Endpoint Transfer Size Register 12

This register reflects the Transfer Size of the IN Endpoint 12 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

This register reflects the status of the IN Endpoint Transmit FIFO Status Register 12 of the Device controller. Note: This register exists for an endpoint *i* if the OTG_EP_DIR_ *i* parameter is 0 or 1 for that endpoint.

ID	R/W	Field	Value ID	Value				Description																											
A	R	INEPTXFSPCAVAIL			IN Endpoint Tx FIFO Space Avail (INEPTxFSpCAvail)																														
Indicates the amount of free space available in the Endpoint Tx FIFO. Values are in terms of 32-bit words. In DRD configurations (OTG_MODE = 0, 1, or 2) with dynamic FIFO sizing feature enabled (OTG_DFIFO_DYNAMIC = 1), the value of this field (before DIEPCTLi.TxFNum is programmed) is - the maximum value of (OTG_TX_HNPERIO_DFIFO_DEPTH, OTG_TX_DINEP_DFIFO_DEPTH_0) during reset, and - OTG_TX_DINEP_DFIFO_DEPTH_0, immediately after reset deassertion After DIEPCTLi.TxFNum is programmed, the value of this field will return OTG_TX_DINEP_DFIFO_DEPTH_0

C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			DATA0EVENFRM	0	DATA0 or Even Frame																													
			DATA1ODDFRM	1	DATA1 or Odd Frame																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
		NAK	1	The core is transmitting NAK handshakes on this endpoint																														
E	RW	EPTYPE			Endpoint Type (EPTType)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
		INTERRUP	3	Interrupt																														
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
		ACTIVE	1	STALL All Active Tokens

ID	R/W	Field	Value ID	Value	Description																													
J	W	SETD0PID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr)																													
					- Applies to isochronous IN endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to Even (micro)Frame																													
K	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to Odd (micro)Frame																													
L	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
M	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint

Device IN Endpoint Interrupt Register 13

This register contains the interrupts for the IN Endpoint 13 of the Device controller. Note: This register exists for an endpoint *i* if the OTG_EP_DIR_*i* parameter is 0 or 1 for that endpoint.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				N M L K J I H G F E D C B A																															
Reset 0x00000080				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																														
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																														
			INACTIVE	0	No Transfer Complete Interrupt																														
			ACTIVE	1	Transfer Complete Interrupt																														
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)																														
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																														
			INACTIVE	0	No Endpoint Disabled Interrupt																														
			ACTIVE	1	Endpoint Disabled Interrupt																														
C	RW	AHBERR			AHB Error (AHBErr)																														
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide.																														
			INACTIVE	0	No AHB Error Interrupt																														
			ACTIVE	1	AHB Error interrupt																														
D	RW	TIMEOUT			Timeout Condition (TimeOUT)																														
					- In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint.																														
			INACTIVE	0	No Timeout interrupt																														
			ACTIVE	1	Timeout interrupt																														
E	RW	INTKNTXFEMP			IN Token Received When TxFIFO is Empty (INTknTXFemp)																														
					Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received.																														
			INACTIVE	0	No IN Token Received interrupt																														
			ACTIVE	1	IN Token Received Interrupt																														

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000080			0 1 0 0 0 0 0 0																															
ID	R/W	Field	Value ID	Value	Description																													
F	RW	INTKNEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																													
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																													
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																													
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																													
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																													
			INACTIVE	0	No Endpoint NAK Effective interrupt																													
			ACTIVE	1	IN Endpoint NAK Effective interrupt																													
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																													
					This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)).																													
			INACTIVE	0	No Transmit FIFO Empty interrupt																													
			ACTIVE	1	Transmit FIFO Empty interrupt																													
I	RW	TXFIFOUNDRN			Fifo Underrun (TxfifoUndrn)																													
					Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint.																													
			INACTIVE	0	No Tx FIFO Underrun interrupt																													
			ACTIVE	1	TxFIFO Underrun interrupt																													
J	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done.																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
K	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
L	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	BbleErr interrupt																													

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

A	RW	XFERSIZE			Transfer Size (XferSize) Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO.																														
B	RW	PKTCNT			Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO.																														
C	RW	MC			MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetch for an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp)																														
			PACKETONE	1	1 packet

Device IN Endpoint Interrupt Register 14

This register contains the interrupts for the IN Endpoint 14 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000080			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																													
			INACTIVE	0	No Transfer Complete Interrupt																													
			ACTIVE	1	Transfer Complete Interrupt																													
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)																													
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																													
			INACTIVE	0	No Endpoint Disabled Interrupt																													
			ACTIVE	1	Endpoint Disabled Interrupt																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000080			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
C	RW	AHBERR			AHB Error (AHBErr)																													
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	TIMEOUT			Timeout Condition (TimeOUT)																													
					- In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint.																													
			INACTIVE	0	No Timeout interrupt																													
			ACTIVE	1	Timeout interrupt																													
E	RW	INTKNTXFEMP			IN Token Received When TxFIFO is Empty (INTknTXFEmp)																													
					Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received interrupt																													
			ACTIVE	1	IN Token Received Interrupt																													
F	RW	INTKNEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																													
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																													
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																													
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																													
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																													
			INACTIVE	0	No Endpoint NAK Effective interrupt																													
			ACTIVE	1	IN Endpoint NAK Effective interrupt																													
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																													
					This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)).																													
			INACTIVE	0	No Transmit FIFO Empty interrupt																													
			ACTIVE	1	Transmit FIFO Empty interrupt																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000080			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
I	RW	TXFIFOUNDRN			Fifo Underrun (TxfifoUndrn)																													
					Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint.																													
			INACTIVE	0	No Tx FIFO Underrun interrupt																													
			ACTIVE	1	TxFIFO Underrun interrupt																													
J	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done.																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
K	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
L	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	BbleErr interrupt																													
M	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No NAK interrupt																													
			ACTIVE	1	NAK Interrupt																													
N	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No NYET interrupt																													
			ACTIVE	1	NYET Interrupt

Device IN Endpoint Transfer Size Register 14

This register reflects the Transfer Size of the IN Endpoint 14 of the Device controller. Note: This register exists for an endpoint i if the OTG_EP_DIR_i parameter is 0 or 1 for that endpoint.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			C C B B B B B B B B B B A A A A A A A A A A A A A A A A A A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize) Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO.																													
B	RW	PKTCNT			Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO.																													
C	RW	MC			MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetch for an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp)																													
			PACKETONE	1	1 packet																													
			PACKETTWO	2	2 packets																													
			PACKETTHREE	3	3 packets

Address offset: 0xAD4

Device IN Endpoint DMA Address Register 14

This register contains the DMA Address for the IN Endpoint 14 of the Device controller. Note: This register exists for an endpoint *i* if the OTG_EP_DIR_ *i* parameter is 0 or 1 for that endpoint.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value		Description																													
A	RW	DMAADDR				Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list.

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: Applies to isochronous IN and OUT endpoints only. Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			DATA0EVENFRM	0	DATA0 or Even Frame																													
			DATA1ODDFRM	1	DATA1 or Odd Frame																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
		NAK	1	The core is transmitting NAK handshakes on this endpoint																														
E	RW	EPTYPE			Endpoint Type (EPTType)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
		INTERRUP	3	Interrupt																														
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
			ACTIVE	1	STALL All Active Tokens

ID	R/W	Field	Value ID	Value	Description
G	RW	TXFNUM			TxFIFO Number (TxFNum) Shared FIFO Operation non-periodic endpoints must set this bit to zero. Periodic endpoints must map this to the corresponding Periodic TxFIFO number. - Others: Specified Periodic TxFIFO.number Note: An interrupt IN endpoint can be configured as a non-periodic endpoint for applications such as mass storage. The core treats an IN endpoint as a non-periodic endpoint if the TxFNum field is set to 0. Otherwise, a separate periodic FIFO must be allocated for an interrupt IN endpoint, and the number of this FIFO must be programmed into the TxFNum field. Configuring an interrupt IN endpoint as a non-periodic endpoint saves the extra periodic FIFO area. Dedicated FIFO Operation: These bits specify the FIFO number associated with this endpoint. Each active IN endpoint must be programmed to a separate FIFO number. This field is valid only for IN endpoints.
			TXFIFO0	0	Tx FIFO 0
			TXFIFO1	1	Tx FIFO 1
			TXFIFO2	2	Tx FIFO 2
			TXFIFO3	3	Tx FIFO 3
			TXFIFO4	4	Tx FIFO 4

ID	R/W	Field	Value ID	Value	Description																													
J	W	SETD0PID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr)																													
					- Applies to isochronous IN endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to Even (micro)Frame																													
K	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd (micro)Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to Odd (micro)Frame																													
L	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
M	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled, -- For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. -- For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. - When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: -- For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. -- For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. - The core clears this bit before setting any of the following interrupts on this endpoint: -- SETUP Phase Done -- Endpoint Disabled -- Transfer Completed Note: For control endpoints in DMA mode, this bit must be set to be able to transfer SETUP data packets in memory.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint																													

Device IN Endpoint Interrupt Register 15

This register contains the interrupts for the IN Endpoint 15 of the Device controller. Note: This register exists for an endpoint *i* if the OTG_EP_DIR_*i* parameter is 0 or 1 for that endpoint.

Bit number					31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID	R/W	Field	Value ID	Value	Description																																	

A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.
			INACTIVE	0	No Transfer Complete Interrupt
			ACTIVE	1	Transfer Complete Interrupt
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.
			INACTIVE	0	No Endpoint Disabled Interrupt
			ACTIVE	1	Endpoint Disabled Interrupt
C	RW	AHBERR			AHB Error (AHBErr)
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" in the Programming Guide.
			INACTIVE	0	No AHB Error Interrupt
			ACTIVE	1	AHB Error interrupt
D	RW	TIMEOUT			Timeout Condition (TimeOUT)
					- In shared TX FIFO mode, applies to non-isochronous IN endpoints only. - In dedicated FIFO mode, applies only to Control IN endpoints. - In Scatter/Gather DMA mode, the TimeOUT interrupt is not asserted. Indicates that the core has detected a timeout condition on the USB for the last IN token on this endpoint.
			INACTIVE	0	No Timeout interrupt
			ACTIVE	1	Timeout interrupt
E	RW	INTKNTXFEMP			IN Token Received When TxFIFO is Empty (INTknTXFEmp)
					Applies to non-periodic IN endpoints only. Indicates that an IN token was received when the associated TxFIFO (periodic/non-periodic) was empty. This interrupt is asserted on the endpoint for which the IN token was received.
			INACTIVE	0	No IN Token Received interrupt
			ACTIVE	1	IN Token Received Interrupt

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
F	RW	INTKNEPMIS			IN Token Received with EP Mismatch (INTknEPMis)																													
					Applies to non-periodic IN endpoints only. Indicates that the data in the top of the non-periodic TxFIFO belongs to an endpoint other than the one for which the IN token was received. This interrupt is asserted on the endpoint for which the IN token was received.																													
			INACTIVE	0	No IN Token Received with EP Mismatch interrupt																													
			ACTIVE	1	IN Token Received with EP Mismatch interrupt																													
G	RW	INEPNAKEFF			IN Endpoint NAK Effective (INEPNakEff)																													
					Applies to periodic IN endpoints only. This bit can be cleared when the application clears the IN endpoint NAK by writing to DIEPCTLn.CNAK. This interrupt indicates that the core has sampled the NAK bit Set (either by the application or by the core). The interrupt indicates that the IN endpoint NAK bit Set by the application has taken effect in the core. This interrupt does not guarantee that a NAK handshake is sent on the USB. A STALL bit takes priority over a NAK bit.																													
			INACTIVE	0	No Endpoint NAK Effective interrupt																													
			ACTIVE	1	IN Endpoint NAK Effective interrupt																													
H	R	TXFEMP			Transmit FIFO Empty (TxFEmp)																													
					This bit is valid only for IN endpoints This interrupt is asserted when the TxFIFO for this endpoint is either half or completely empty. The half or completely empty status is determined by the TxFIFO Empty Level bit in the Core AHB Configuration register (GAHBCFG.NPTxFEmpLvl)).																													
			INACTIVE	0	No Transmit FIFO Empty interrupt																													
			ACTIVE	1	Transmit FIFO Empty interrupt																													
I	RW	TXFIFOUNDRN			Fifo Underrun (TxfifoUndrn)																													
					Applies to IN endpoints Only This bit is valid only If thresholding is enabled. The core generates this interrupt when it detects a transmit FIFO underrun condition for this endpoint.																													
			INACTIVE	0	No Tx FIFO Underrun interrupt																													
			ACTIVE	1	TxFIFO Underrun interrupt																													
J	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done.																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
K	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
L	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	BbleErr interrupt

ID	R/W	Field	Value ID	Value	Description																														
A	RW	XFERSIZE			Transfer Size (XferSize) Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet from the external memory is written to the TxFIFO.																														
B	RW	PKTCNT			Packet Count (PktCnt) Indicates the total number of USB packets that constitute the Transfer Size amount of data for endpoint 0. This field is decremented every time a packet (maximum size or short packet) is read from the TxFIFO.																														
C	RW	MC			MC Applies to IN endpoints only. For periodic IN endpoints, this field indicates the number of packets that must be transmitted per microframe on the USB. The core uses this field to calculate the data PID for isochronous IN endpoints. For non-periodic IN endpoints, this field is valid only in Internal DMA mode. It specifies the number of packets the core must fetch for an IN endpoint before it switches to the endpoint pointed to by the Next Endpoint field of the Device Endpoint-n Control register (DIEPCTLn.NextEp)																														
			PACKETONE	1	1 packet																														
			PACKETTWO	2	2 packets

					The maximum packet size for control OUT endpoint 0 is the same as what is programmed in control IN Endpoint 0.																														
			BYTE64	0	64 bytes																														
			BYTE32	1	32 bytes																														
			BYTE16	2	16 bytes																														
			BYTE8	3	8 bytes																														
B	R	USBACTEP			USB Active Endpoint (USBActEP)																														
					This bit is always set to 1, indicating that a control endpoint 0 is always active in all configurations and interfaces.																														
			ACTIVE	1	USB Active Endpoint 0																														
C	R	NAKSTS			NAK Status (NAKSts)																														
					Indicates the following: When either the application or the core sets this bit, the core stops receiving data, even If there is space in the RxFIFO to accommodate the incoming packet. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																														
			INACTIVE	0	The core is transmitting non-NAK handshakes based on the FIFO status																														
			ACTIVE	1	The core is transmitting NAK handshakes on this endpoint																														
D	R	EPTYPE			Endpoint Type (EPTYPE)																														
					Hardcoded to 2'b00 for control.																														
			ACTIVE	0	Endpoint Control 0																														
E	RW	STALL			STALL Handshake (Stall)																														
					The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit or Global OUT NAK is Set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																														
			INACTIVE	0	No Stall																														
			ACTIVE	1	Stall Handshake																														
F	W	CNAK			Clear NAK (CNAK)																														
					A write to this bit clears the NAK bit for the endpoint.																														
			NOCLEAR	0	No action																														
			CLEAR	1	Clear NAK																														
G	W	SNAK			Set NAK (SNAK)																														
					A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set bit on a Transfer Completed interrupt, or after a SETUP is received on the endpoint.																														
			NOSET	0	No action																														
			SET	1	Set NAK																														
H	R	EPDIS			Endpoint Disable (EPDis)																														
					The application cannot disable control OUT endpoint 0.																														
			INACTIVE	0	No Endpoint disable

Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																														
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled - For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. - For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. Note: In DMA mode, this bit must be set for the core to transfer SETUP data packets into memory. When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																														
			INACTIVE	0	No Transfer Complete Interrupt																														
			ACTIVE	1	Transfer Complete Interrupt																														
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)																														
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																														
			INACTIVE	0	No Endpoint Disabled Interrupt																														
			ACTIVE	1	Endpoint Disabled Interrupt																														
C	RW	AHBERR			AHB Error (AHBErr)																														
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																														

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																														
			INACTIVE	0	No AHB Error Interrupt																														
			ACTIVE	1	AHB Error interrupt																														
D	RW	SETUP			SETUP Phase Done (SetUp)																														
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																														
			INACTIVE	0	No SETUP Phase Done																														
			ACTIVE	1	SETUP Phase Done																														
E	RW	OUTTKNEPDIS			OUT Token Received When Endpoint Disabled (OUTTKnEPdis)																														
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																														
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																														
			ACTIVE	1	OUT Token Received When Endpoint Disabled																														
F	RW	STSPHSERCVD			Status Phase Received for Control Write (StsPhseRcvd)																														
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																														
			INACTIVE	0	No Status Phase Received for Control Write																														
			ACTIVE	1	Status Phase Received for Control Write																														
G	RW	BACK2BACKSETUP			Back-to-Back SETUP Packets Received (Back2BackSETup)																														
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																														
			INACTIVE	0	No Back-to-Back SETUP Packets Received																														
			ACTIVE	1	Back-to-Back SETUP Packets Received																														
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																														
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																														
			INACTIVE	0	No OUT Packet Error																														
			ACTIVE	1	OUT Packet Error																														
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																														
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the core to process, such as Host busy or DMA done.																														
			INACTIVE	0	No BNA interrupt																														
			ACTIVE	1	BNA interrupt																														

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID				N M L K J I H G F E D C B A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																														
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																														
			INACTIVE	0	No interrupt																														
			ACTIVE	1	Packet Drop Status interrupt																														
K	RW	BBLEERR			NAK Interrupt (BbleErr)																														
					The core generates this interrupt when babble is received for the endpoint.																														
			INACTIVE	0	No BbleErr interrupt																														
	ACTIVE	1	BbleErr interrupt																																
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																														
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																														
			INACTIVE	0	No NAK interrupt																														
	ACTIVE	1	NAK Interrupt																																
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																														
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																														
			INACTIVE	0	No NYET interrupt																														
	ACTIVE	1	NYET Interrupt																																
N	RW	STUPPKTRCVD			Setup Packet Received																														
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																														
			NOTRCVD	0	No Setup packet received																														
		RCVD	1	Setup packet received

ID	R/W	Field	Value ID	Value	Description
A	RW	MPS			Maximum Packet Size (MPS)
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.
B	RW	USBACTEP			USB Active Endpoint (USBActEP)
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.
			DISABLED	0	Not Active
			ENABLED	1	USB Active Endpoint
C	R	DPID			Endpoint Data PID (DPID)
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.
			INACTIVE	0	Endpoint Data PID not active
			ACTIVE	1	Endpoint Data PID active
D	R	NAKSTS			NAK Status (NAKSts)
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status
			NAK	1	The core is transmitting NAK handshakes on this endpoint
E	RW	EPTYPE			Endpoint Type (EPTYPE)
					This is the transfer type supported by this logical endpoint.
			CONTROL	0	Control
			ISOCHRONOUS	1	Isochronous
			BULK	2	Bulk
			INTERRUPT	3	Interrupt

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			L K J I H G								F E E D C B								A A A A A A A A A A															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
			ACTIVE	1	STALL All Active Tokens																													
G	W	CNAK			Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint.																													
			INACTIVE	0	No Clear NAK																													
			ACTIVE	1	Clear NAK																													
H	W	SNAK			Set NAK (SNAK)																													
					A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint.																													
			INACTIVE	0	No Set NAK																													
			ACTIVE	1	Set NAK																													
I	W	SETD0PID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd (micro)Frame																													
J	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd (micro)Frame																													

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
K	RW	EPDIS			Endpoint Disable (EPDis)																														
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																														
			INACTIVE	0	No Action																														
			ACTIVE	1	Disable Endpoint																														
L	RW	EPENA			Endpoint Enable (EPEna)																														
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit is not cleared on Transfer Completed interrupt of the SETUP packet.																														
			INACTIVE	0	No Action																														
			ACTIVE	1	Enable Endpoint

Device OUT Endpoint Interrupt Register 1

This register contains the interrupts for the OUT Endpoint 1 of the Device controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																													
			INACTIVE	0	No Transfer Complete Interrupt																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
B	RW	EPDISBLD	ACTIVE	1	Transfer Complete Interrupt																													
					Endpoint Disabled Interrupt (EPDisbld)																													
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																													
			INACTIVE	0	No Endpoint Disabled Interrupt																													
C	RW	AHBERR	ACTIVE	1	Endpoint Disabled Interrupt																													
					AHB Error (AHBErr)																													
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
D	RW	SETUP	ACTIVE	1	AHB Error interrupt																													
					SETUP Phase Done (SetUp)																													
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																													
			INACTIVE	0	No SETUP Phase Done																													
E	RW	OUTTKNEPDIS	ACTIVE	1	SETUP Phase Done																													
					OUT Token Received When Endpoint Disabled (OUTTKnEPdis)																													
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																													
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																													
F	RW	STSPHSERCVD	ACTIVE	1	OUT Token Received When Endpoint Disabled																													
					Status Phase Received for Control Write (StsPhseRcvd)																													
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																													
			INACTIVE	0	No Status Phase Received for Control Write																													
G	RW	BACK2BACKSETUP	ACTIVE	1	Status Phase Received for Control Write																													
					Back-to-Back SETUP Packets Received (Back2BackSETup)																													
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																													
			INACTIVE	0	No Back-to-Back SETUP Packets Received																													
			ACTIVE	1	Back-to-Back SETUP Packets Received																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																													
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																													
			INACTIVE	0	No OUT Packet Error																													
			ACTIVE	1	OUT Packet Error																													
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
K	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No BbleErr interrupt																													
			ACTIVE	1	BbleErr interrupt																													
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No NAK interrupt																													
			ACTIVE	1	NAK Interrupt																													
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No NYET interrupt																													
			ACTIVE	1	NYET Interrupt																													
N	RW	STUPPKTRCVD			Setup Packet Received																													
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																													
			NOTRCVD	0	No Setup packet received																													
			RCVD	1	Setup packet received

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize)																													
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory.																													
B	RW	PKTCNT			Packet Count (PktCnt)																													
					This field is decremented to zero after a packet is written into the RxFIFO.																													
C	R	RXDPID			RxDPID																													
					Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive.																													
			DATA0	0	DATA0																													
			DATA2PACKET1	1	DATA2 or 1 packet																													
			DATA1PACKET2	2	DATA1 or 2 packets																													
			MDATAPACKET3	3	MDATA or 3 packets

Device OUT Endpoint DMA Address Register 1

This register contains the DMA Address for the OUT Endpoint 1 of the Device controller.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	RW	DMAADDR						Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list.

ID	R/W	Field	Value ID	Value	Description																													
A	RW	MPS			Maximum Packet Size (MPS)																													
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.																													
B	RW	USBACTEP			USB Active Endpoint (USBActEP)																													
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.																													
			DISABLED	0	Not Active																													
			ENABLED	1	USB Active Endpoint																													
C	R	DPID			Endpoint Data PID (DPID)																													
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			INACTIVE	0	Endpoint Data PID not active																													
			ACTIVE	1	Endpoint Data PID active																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint

Device OUT Endpoint Interrupt Register 2

This register contains the interrupts for the OUT Endpoint 2 of the Device controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																																			
ID			N M L K J I H G F E D C B A																																			
Reset 0x00000000			0 0																																			
ID	R/W	Field	Value ID	Value	Description																																	
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																																	
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																																	
			INACTIVE	0	No Transfer Complete Interrupt																																	
			ACTIVE	1	Transfer Complete Interrupt																																	
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)																																	
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																																	
			INACTIVE	0	No Endpoint Disabled Interrupt																																	
			ACTIVE	1	Endpoint Disabled Interrupt																																	
C	RW	AHBERR			AHB Error (AHBErr)																																	
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																																	
			INACTIVE	0	No AHB Error Interrupt																																	
			ACTIVE	1	AHB Error interrupt																																	
D	RW	SETUP			SETUP Phase Done (SetUp)																																	
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																																	
			INACTIVE	0	No SETUP Phase Done																																	
			ACTIVE	1	SETUP Phase Done																																	
E	RW	OUTTKNEPDIS			OUT Token Received When Endpoint Disabled (OUTTkNEPdis)																																	
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																																	
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																																	
			ACTIVE	1	OUT Token Received When Endpoint Disabled																																	
F	RW	STSPHSERCVD			Status Phase Received for Control Write (StsPhseRcvd)																																	
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																																	
			INACTIVE	0	No Status Phase Received for Control Write																																	
			ACTIVE	1	Status Phase Received for Control Write																																	

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
G	RW	BACK2BACKSETUP			Back-to-Back SETUP Packets Received (Back2BackSETup)																													
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																													
			INACTIVE	0	No Back-to-Back SETUP Packets Received																													
			ACTIVE	1	Back-to-Back SETUP Packets Received																													
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																													
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																													
			INACTIVE	0	No OUT Packet Error																													
			ACTIVE	1	OUT Packet Error																													
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
K	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No BbleErr interrupt																													
			ACTIVE	1	BbleErr interrupt																													
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No NAK interrupt																													
			ACTIVE	1	NAK Interrupt																													
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No NYET interrupt																													
			ACTIVE	1	NYET Interrupt																													

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID	R/W	Field	Value ID	Value	Description																																
N	RW	STUPPKTRCVD			Setup Packet Received																																
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																																
			NOTRCVD	0	No Setup packet received																																
			RCVD	1	Setup packet received

ID	R/W	Field	Value ID	Value	Description																														
A	RW	XFERSIZE			Transfer Size (XferSize)																														
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory.																														
B	RW	PKTCNT			Packet Count (PktCnt)																														
					This field is decremented to zero after a packet is written into the RxFIFO.																														
C	R	RXDPID			RxDPID																														
					Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive.																														
			DATA0	0	DATA0																														
			DATA2PACKET1	1	DATA2 or 1 packet																														
			DATA1PACKET2	2	DATA1 or 2 packets																														
			MDATAPACKET3	3	MDATA or 3 packets

ID	R/W	Field	Value ID	Value	Description																											

A	RW	DMAADDR			Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list.

Reset 0x00000000	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ID	R/W	Field	Value ID	Value	Description
A	RW	MPS			Maximum Packet Size (MPS)
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.
B	RW	USBACTEP			USB Active Endpoint (USBActEP)
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.
			DISABLED	0	Not Active
			ENABLED	1	USB Active Endpoint
C	R	DPID			Endpoint Data PID (DPID)
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.
			INACTIVE	0	Endpoint Data PID not active
			ACTIVE	1	Endpoint Data PID active
D	R	NAKSTS			NAK Status (NAKSts)
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status
			NAK	1	The core is transmitting NAK handshakes on this endpoint
E	RW	EPTYPE			Endpoint Type (EPTYPE)
					This is the transfer type supported by this logical endpoint.
			CONTROL	0	Control
			ISOCHRONOUS	1	Isochronous
			BULK	2	Bulk
			INTERRUPT	3	Interrupt

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
F	RW	STALL			STALL Handshake (Stall)																														
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																														
			INACTIVE	0	STALL All non-active tokens																														
			ACTIVE	1	STALL All Active Tokens																														
G	W	CNAK			Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint.																														
			INACTIVE	0	No Clear NAK																														
			ACTIVE	1	Clear NAK																														
H	W	SNAK			Set NAK (SNAK)																														
					A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint.																														
			INACTIVE	0	No Set NAK																														
			ACTIVE	1	Set NAK																														
I	W	SETD0PID			Set DATA0 PID (SetD0PID)																														
					- Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																														
			DISABLED	0	Disables Set DATA0 PID or Do not force Even Frame																														
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd (micro)Frame																														
J	W	SETD1PID			Set DATA1 PID (SetD1PID)																														
					- Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																														
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd Frame																														
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd (micro)Frame																														

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																														
K	RW	EPDIS			Endpoint Disable (EPDis)																														
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																														
			INACTIVE	0	No Action																														
			ACTIVE	1	Disable Endpoint																														
L	RW	EPENA			Endpoint Enable (EPEna)																														
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit is not cleared on Transfer Completed interrupt of the SETUP packet.																														
			INACTIVE	0	No Action																														
			ACTIVE	1	Enable Endpoint

A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																													
			INACTIVE	0	No Transfer Complete Interrupt

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize)																													
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory.																													
B	RW	PKTCNT			Packet Count (PktCnt)																													
					This field is decremented to zero after a packet is written into the RxFIFO.																													
C	R	RXDPID			RxDPID																													
					Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive.																													
			DATA0	0	DATA0																													
			DATA2PACKET1	1	DATA2 or 1 packet																													
			DATA1PACKET2	2	DATA1 or 2 packets																													
			MDATAPACKET3	3	MDATA or 3 packets

Device OUT Endpoint DMA Address Register 4

This register contains the DMA Address for the OUT Endpoint 4 of the Device controller.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	RW	DMAADDR						Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list.

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	MPS			Maximum Packet Size (MPS)																													
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.																													
B	RW	USBACTEP			USB Active Endpoint (USBActEP)																													
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.																													
			DISABLED	0	Not Active																													
			ENABLED	1	USB Active Endpoint																													
C	R	DPID			Endpoint Data PID (DPID)																													
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			INACTIVE	0	Endpoint Data PID not active																													
			ACTIVE	1	Endpoint Data PID active																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			L K J I H G F E E D C B A A A A A A A A A A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
E	RW	EPTYPE			Endpoint Type (EPTYPE)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
			INTERRUPT	3	Interrupt																													
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
			ACTIVE	1	STALL All Active Tokens																													
G	W	CNAK			Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint.																													
			INACTIVE	0	No Clear NAK																													
			ACTIVE	1	Clear NAK																													
H	W	SNAK			Set NAK (SNAK)																													
					A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint.																													
			INACTIVE	0	No Set NAK																													
			ACTIVE	1	Set NAK																													
I	W	SETDOPID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd (micro)Frame																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			L K J I H G F E E D C B A A A A A A A A A A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
J	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd (micro)Frame																													
K	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
L	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit is not cleared on Transfer Completed interrupt of the SETUP packet.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint

Device OUT Endpoint Interrupt Register 5

This register contains the interrupts for the OUT Endpoint 5 of the Device controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																													
			INACTIVE	0	No Transfer Complete Interrupt																													
			ACTIVE	1	Transfer Complete Interrupt																													
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)																													
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																													
			INACTIVE	0	No Endpoint Disabled Interrupt																													
			ACTIVE	1	Endpoint Disabled Interrupt																													
C	RW	AHBERR			AHB Error (AHBErr)																													
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	SETUP			SETUP Phase Done (SetUp)																													
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																													
			INACTIVE	0	No SETUP Phase Done																													
			ACTIVE	1	SETUP Phase Done																													
E	RW	OUTTKNEPDIS			OUT Token Received When Endpoint Disabled (OUTTkNEPdis)																													
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																													
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																													
			ACTIVE	1	OUT Token Received When Endpoint Disabled																													
F	RW	STSPHSERCVD			Status Phase Received for Control Write (StsPhseRcvd)																													
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																													
			INACTIVE	0	No Status Phase Received for Control Write																													
			ACTIVE	1	Status Phase Received for Control Write																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
G	RW	BACK2BACKSETUP			Back-to-Back SETUP Packets Received (Back2BackSETup)																													
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																													
			INACTIVE	0	No Back-to-Back SETUP Packets Received																													
			ACTIVE	1	Back-to-Back SETUP Packets Received																													
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																													
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																													
			INACTIVE	0	No OUT Packet Error																													
			ACTIVE	1	OUT Packet Error																													
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
K	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No BbleErr interrupt																													
			ACTIVE	1	BbleErr interrupt																													
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No NAK interrupt																													
			ACTIVE	1	NAK Interrupt																													
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No NYET interrupt																													
			ACTIVE	1	NYET Interrupt																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
N	RW	STUPPKTRCVD			Setup Packet Received																													
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																													
			NOTRCVD	0	No Setup packet received																													
			RCVD	1	Setup packet received

C	R	DPID			Endpoint Data PID (DPID)																													
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			INACTIVE	0	Endpoint Data PID not active																													
			ACTIVE	1	Endpoint Data PID active																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint																													
E	RW	EPTYPE			Endpoint Type (EPTYPE)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
			INTERRUPT	3	Interrupt																													
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
			ACTIVE	1	STALL All Active Tokens

L	RW	EPENA			Endpoint Enable (EPEna)																																			
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit is not cleared on Transfer Completed interrupt of the SETUP packet.																																			
			INACTIVE	0	No Action																																			
			ACTIVE	1	Enable Endpoint

Device OUT Endpoint Interrupt Register 6

This register contains the interrupts for the OUT Endpoint 6 of the Device controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																													
			INACTIVE	0	No Transfer Complete Interrupt																													
			ACTIVE	1	Transfer Complete Interrupt																													
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)																													
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																													
			INACTIVE	0	No Endpoint Disabled Interrupt																													
			ACTIVE	1	Endpoint Disabled Interrupt																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
C	RW	AHBERR			AHB Error (AHBErr)																													
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	SETUP			SETUP Phase Done (SetUp)																													
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																													
			INACTIVE	0	No SETUP Phase Done																													
			ACTIVE	1	SETUP Phase Done																													
E	RW	OUTTKNEPDIS			OUT Token Received When Endpoint Disabled (OUTTknEPdis)																													
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																													
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																													
			ACTIVE	1	OUT Token Received When Endpoint Disabled																													
F	RW	STSPHSERCVD			Status Phase Received for Control Write (StsPhseRcvd)																													
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																													
			INACTIVE	0	No Status Phase Received for Control Write																													
			ACTIVE	1	Status Phase Received for Control Write																													
G	RW	BACK2BACKSETUP			Back-to-Back SETUP Packets Received (Back2BackSETup)																													
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																													
			INACTIVE	0	No Back-to-Back SETUP Packets Received																													
			ACTIVE	1	Back-to-Back SETUP Packets Received																													
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																													
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																													
			INACTIVE	0	No OUT Packet Error																													
			ACTIVE	1	OUT Packet Error																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
K	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No BbleErr interrupt																													
			ACTIVE	1	BbleErr interrupt																													
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No NAK interrupt																													
			ACTIVE	1	NAK Interrupt																													
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No NYET interrupt																													
			ACTIVE	1	NYET Interrupt																													
N	RW	STUPPKTRCVD			Setup Packet Received																													
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																													
			NOTRCVD	0	No Setup packet received																													
			RCVD	1	Setup packet received

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize)																													
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory.																													
B	RW	PKTCNT			Packet Count (PktCnt)																													
					This field is decremented to zero after a packet is written into the RxFIFO.																													
C	R	RXDPID			RxDPID																													
					Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive.																													
			DATA0	0	DATA0																													
			DATA2PACKET1	1	DATA2 or 1 packet																													
			DATA1PACKET2	2	DATA1 or 2 packets																													
			MDATAPACKET3	3	MDATA or 3 packets

Device OUT Endpoint DMA Address Register 6

This register contains the DMA Address for the OUT Endpoint 6 of the Device controller.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	RW	DMAADDR						Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list.

ID	R/W	Field	Value ID	Value	Description
A	RW	MPS			Maximum Packet Size (MPS)
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.
B	RW	USBACTEP			USB Active Endpoint (USBActEP)
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.
			DISABLED	0	Not Active
			ENABLED	1	USB Active Endpoint
C	R	DPID			Endpoint Data PID (DPID)
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.
			INACTIVE	0	Endpoint Data PID not active
			ACTIVE	1	Endpoint Data PID active
D	R	NAKSTS			NAK Status (NAKSts)
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status
			NAK	1	The core is transmitting NAK handshakes on this endpoint
E	RW	EPTYPE			Endpoint Type (EPTYPE)
					This is the transfer type supported by this logical endpoint.
			CONTROL	0	Control
			ISOCHRONOUS	1	Isochronous
			BULK	2	Bulk
			INTERRUPT	3	Interrupt

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
			ACTIVE	1	STALL All Active Tokens																													
G	W	CNAK			Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint.																													
			INACTIVE	0	No Clear NAK																													
			ACTIVE	1	Clear NAK																													
H	W	SNAK			Set NAK (SNAK)																													
					A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint.																													
			INACTIVE	0	No Set NAK																													
			ACTIVE	1	Set NAK																													
I	W	SETD0PID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd (micro)Frame																													
J	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd (micro)Frame

ID	R/W	Field	Value ID	Value	Description																														
K	RW	EPDIS			Endpoint Disable (EPDis)																														
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																														
			INACTIVE	0	No Action																														
			ACTIVE	1	Disable Endpoint																														
L	RW	EPENA			Endpoint Enable (EPEna)																														
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit is not cleared on Transfer Completed interrupt of the SETUP packet.																														
			INACTIVE	0	No Action																														
			ACTIVE	1	Enable Endpoint

ID	R/W	Field	Value ID	Value				Description																											
A	RW	DMAADDR						Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list.

Device Control OUT Endpoint Control Register 8

This register is used to control the characteristics of OUT Endpoint 8 of the Device controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			L K J I H G								F E E D C B								A A A A A A A A A A A A A A A															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	MPS			Maximum Packet Size (MPS)																													
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.																													
B	RW	USBACTEP			USB Active Endpoint (USBActEP)																													
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.																													
			DISABLED	0	Not Active																													
			ENABLED	1	USB Active Endpoint																													
C	R	DPID			Endpoint Data PID (DPID)																													
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			INACTIVE	0	Endpoint Data PID not active																													
			ACTIVE	1	Endpoint Data PID active																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			L K J I H G F E E D C B A A A A A A A A A A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
E	RW	EPTYPE			Endpoint Type (EPTYPE)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
			INTERRUPT	3	Interrupt																													
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
			ACTIVE	1	STALL All Active Tokens																													
G	W	CNAK			Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint.																													
			INACTIVE	0	No Clear NAK																													
			ACTIVE	1	Clear NAK																													
H	W	SNAK			Set NAK (SNAK)																													
					A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint.																													
			INACTIVE	0	No Set NAK																													
			ACTIVE	1	Set NAK																													
I	W	SETDOPID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd (micro)Frame																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			L K J I H G F E E D C B A A A A A A A A A A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
J	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd (micro)Frame																													
K	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
L	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit is not cleared on Transfer Completed interrupt of the SETUP packet.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint

Device OUT Endpoint Interrupt Register 8

This register contains the interrupts for the OUT Endpoint 8 of the Device controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																													
			INACTIVE	0	No Transfer Complete Interrupt																													
			ACTIVE	1	Transfer Complete Interrupt																													
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)																													
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																													
			INACTIVE	0	No Endpoint Disabled Interrupt																													
			ACTIVE	1	Endpoint Disabled Interrupt																													
C	RW	AHBERR			AHB Error (AHBErr)																													
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	SETUP			SETUP Phase Done (SetUp)																													
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																													
			INACTIVE	0	No SETUP Phase Done																													
			ACTIVE	1	SETUP Phase Done																													
E	RW	OUTTKNEPDIS			OUT Token Received When Endpoint Disabled (OUTTkNEPdis)																													
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																													
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																													
			ACTIVE	1	OUT Token Received When Endpoint Disabled																													
F	RW	STSPHSERCVD			Status Phase Received for Control Write (StsPhseRcvd)																													
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																													
			INACTIVE	0	No Status Phase Received for Control Write																													
			ACTIVE	1	Status Phase Received for Control Write																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
G	RW	BACK2BACKSETUP			Back-to-Back SETUP Packets Received (Back2BackSETup)																													
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																													
			INACTIVE	0	No Back-to-Back SETUP Packets Received																													
			ACTIVE	1	Back-to-Back SETUP Packets Received																													
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																													
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																													
			INACTIVE	0	No OUT Packet Error																													
			ACTIVE	1	OUT Packet Error																													
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
K	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No BbleErr interrupt																													
			ACTIVE	1	BbleErr interrupt																													
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No NAK interrupt																													
			ACTIVE	1	NAK Interrupt																													
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No NYET interrupt																													
			ACTIVE	1	NYET Interrupt																													

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
N	RW	STUPPKTRCVD			Setup Packet Received																														
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																														
			NOTRCVD	0	No Setup packet received																														
			RCVD	1	Setup packet received

ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize)																													
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory.																													
B	RW	PKTCNT			Packet Count (PktCnt)																													
					This field is decremented to zero after a packet is written into the RxFIFO.																													
C	R	RXDPID			RxDPID																													
					Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive.																													
			DATA0	0	DATA0																													
			DATA2PACKET1	1	DATA2 or 1 packet																													
			DATA1PACKET2	2	DATA1 or 2 packets																													
			MDATAPACKET3	3	MDATA or 3 packets

C	R	DPID			Endpoint Data PID (DPID)																													
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																													
			INACTIVE	0	Endpoint Data PID not active																													
			ACTIVE	1	Endpoint Data PID active																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint																													
E	RW	EPTYPE			Endpoint Type (EPTYPE)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCHRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
			INTERRUPT	3	Interrupt																													
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.

					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	SETUP			SETUP Phase Done (SetUp)																													
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																													
			INACTIVE	0	No SETUP Phase Done																													
			ACTIVE	1	SETUP Phase Done																													
E	RW	OUTTKNEPDIS			OUT Token Received When Endpoint Disabled (OUTTknEPdis)																													
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																													
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																													
			ACTIVE	1	OUT Token Received When Endpoint Disabled																													
F	RW	STSPHSERCVD			Status Phase Received for Control Write (StsPhseRcvd)																													
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																													
			INACTIVE	0	No Status Phase Received for Control Write																													
			ACTIVE	1	Status Phase Received for Control Write																													
G	RW	BACK2BACKSETUP			Back-to-Back SETUP Packets Received (Back2BackSETup)																													
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																													
			INACTIVE	0	No Back-to-Back SETUP Packets Received																													
			ACTIVE	1	Back-to-Back SETUP Packets Received																													
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																													
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																													
			INACTIVE	0	No OUT Packet Error																													
			ACTIVE	1	OUT Packet Error																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																														
ID	R/W	Field	Value ID	Value	Description																												
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																												
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done																												
			INACTIVE	0	No BNA interrupt																												
			ACTIVE	1	BNA interrupt																												
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																												
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																												
			INACTIVE	0	No interrupt																												
			ACTIVE	1	Packet Drop Status interrupt																												
K	RW	BBLEERR			NAK Interrupt (BbleErr)																												
					The core generates this interrupt when babble is received for the endpoint.																												
			INACTIVE	0	No BbleErr interrupt																												
			ACTIVE	1	BbleErr interrupt																												
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																												
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																												
			INACTIVE	0	No NAK interrupt																												
			ACTIVE	1	NAK Interrupt																												
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																												
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																												
			INACTIVE	0	No NYET interrupt																												
			ACTIVE	1	NYET Interrupt																												
N	RW	STUPPKTRCVD			Setup Packet Received																												
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																												
			NOTRCVD	0	No Setup packet received																												
			RCVD	1	Setup packet received

ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize)																													
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory.																													
B	RW	PKTCNT			Packet Count (PktCnt)																													
					This field is decremented to zero after a packet is written into the RxFIFO.																													
C	R	RXDPID			RxDPID																													
					Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive.																													
			DATA0	0	DATA0																													
			DATA2PACKET1	1	DATA2 or 1 packet																													
			DATA1PACKET2	2	DATA1 or 2 packets																													
			MDATAPACKET3	3	MDATA or 3 packets

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	MPS			Maximum Packet Size (MPS) The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.																													
B	RW	USBACTEP			USB Active Endpoint (USBActEP) Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit. DISABLED 0 Not Active ENABLED 1 USB Active Endpoint																													
C	R	DPID			Endpoint Data PID (DPID) Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure. INACTIVE 0 Endpoint Data PID not active ACTIVE 1 Endpoint Data PID active																													
D	R	NAKSTS			NAK Status (NAKSts) Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake. NONNAK 0 The core is transmitting non-NAK handshakes based on the FIFO status NAK 1 The core is transmitting NAK handshakes on this endpoint																													
E	RW	EPTYPE			Endpoint Type (EPTYPE) This is the transfer type supported by this logical endpoint. CONTROL 0 Control ISOCHRONOUS 1 Isochronous BULK 2 Bulk INTERRUPT 3 Interrupt																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
			ACTIVE	1	STALL All Active Tokens																													
G	W	CNAK			Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint.																													
			INACTIVE	0	No Clear NAK																													
			ACTIVE	1	Clear NAK																													
H	W	SNAK			Set NAK (SNAK)																													
					A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint.																													
			INACTIVE	0	No Set NAK																													
			ACTIVE	1	Set NAK																													
I	W	SETD0PID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd (micro)Frame																													
J	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd (micro)Frame																													

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000				0 0																																					
ID	R/W	Field	Value ID	Value	Description																																				
K	RW	EPDIS			Endpoint Disable (EPDis)																																				
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																																				
			INACTIVE	0	No Action																																				
			ACTIVE	1	Disable Endpoint																																				
L	RW	EPENA			Endpoint Enable (EPEna)																																				
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit is not cleared on Transfer Completed interrupt of the SETUP packet.																																				
			INACTIVE	0	No Action																																				
			ACTIVE	1	Enable Endpoint

			ACTIVE	1	Endpoint Data PID active																													
D	R	NAKSTS			NAK Status (NAKSts)																													
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																													
			NAK	1	The core is transmitting NAK handshakes on this endpoint																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			L K J I H G F E E D C B A A A A A A A A A A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
E	RW	EPTYPE			Endpoint Type (EPTYPE)																													
					This is the transfer type supported by this logical endpoint.																													
			CONTROL	0	Control																													
			ISOCRONOUS	1	Isochronous																													
			BULK	2	Bulk																													
			INTERRUPT	3	Interrupt																													
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
			ACTIVE	1	STALL All Active Tokens																													
G	W	CNAK			Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint.																													
			INACTIVE	0	No Clear NAK																													
			ACTIVE	1	Clear NAK																													
H	W	SNAK			Set NAK (SNAK)																													
					A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint.																													
			INACTIVE	0	No Set NAK																													
			ACTIVE	1	Set NAK																													
I	W	SETDOPID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd (micro)Frame																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
J	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd (micro)Frame																													
K	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
L	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit is not cleared on Transfer Completed interrupt of the SETUP packet.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint

Device OUT Endpoint Interrupt Register 11

This register contains the interrupts for the OUT Endpoint 11 of the Device controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																													
			INACTIVE	0	No Transfer Complete Interrupt																													
			ACTIVE	1	Transfer Complete Interrupt																													
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)																													
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																													
			INACTIVE	0	No Endpoint Disabled Interrupt																													
			ACTIVE	1	Endpoint Disabled Interrupt																													
C	RW	AHBERR			AHB Error (AHBErr)																													
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	SETUP			SETUP Phase Done (SetUp)																													
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																													
			INACTIVE	0	No SETUP Phase Done																													
			ACTIVE	1	SETUP Phase Done																													
E	RW	OUTTKNEPDIS			OUT Token Received When Endpoint Disabled (OUTTkNEPdis)																													
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																													
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																													
			ACTIVE	1	OUT Token Received When Endpoint Disabled																													
F	RW	STSPHSERCVD			Status Phase Received for Control Write (StsPhseRcvd)																													
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																													
			INACTIVE	0	No Status Phase Received for Control Write																													
			ACTIVE	1	Status Phase Received for Control Write																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
G	RW	BACK2BACKSETUP			Back-to-Back SETUP Packets Received (Back2BackSETup)																													
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																													
			INACTIVE	0	No Back-to-Back SETUP Packets Received																													
			ACTIVE	1	Back-to-Back SETUP Packets Received																													
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																													
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																													
			INACTIVE	0	No OUT Packet Error																													
			ACTIVE	1	OUT Packet Error																													
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
K	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No BbleErr interrupt																													
			ACTIVE	1	BbleErr interrupt																													
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No NAK interrupt																													
			ACTIVE	1	NAK Interrupt																													
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No NYET interrupt																													
			ACTIVE	1	NYET Interrupt																													

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
N	RW	STUPPKTRCVD			Setup Packet Received																														
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																														
			NOTRCVD	0	No Setup packet received																														
			RCVD	1	Setup packet received

ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize)																													
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory.																													
B	RW	PKTCNT			Packet Count (PktCnt)																													
					This field is decremented to zero after a packet is written into the RxFIFO.																													
C	R	RXDPID			RxDPID																													
					Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive.																													
			DATA0	0	DATA0																													
			DATA2PACKET1	1	DATA2 or 1 packet																													
			DATA1PACKET2	2	DATA1 or 2 packets																													
			MDATAPACKET3	3	MDATA or 3 packets

ID	R/W	Field	Value ID	Value	Description
A	RW	DMAADDR			Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list.

ID	R/W	Field	Value ID	Value	Description																												
C	R	DPID			Endpoint Data PID (DPID)																												
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)Frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvnFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.																												
			INACTIVE	0	Endpoint Data PID not active																												
			ACTIVE	1	Endpoint Data PID active																												
D	R	NAKSTS			NAK Status (NAKSts)																												
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																												
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status																												
			NAK	1	The core is transmitting NAK handshakes on this endpoint																												
E	RW	EPTYPE			Endpoint Type (EPTYPE)																												
					This is the transfer type supported by this logical endpoint.																												
			CONTROL	0	Control																												
			ISOCHRONOUS	1	Isochronous																												
			BULK	2	Bulk																												
			INTERRUPT	3	Interrupt																												
F	RW	STALL			STALL Handshake (Stall)																												
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																												
			INACTIVE	0	STALL All non-active tokens																												
			ACTIVE	1	STALL All Active Tokens																												

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	SETUP			SETUP Phase Done (SetUp)																													
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																													
			INACTIVE	0	No SETUP Phase Done																													
			ACTIVE	1	SETUP Phase Done																													
E	RW	OUTTKNEPDIS			OUT Token Received When Endpoint Disabled (OUTTknEPdis)																													
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																													
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																													
			ACTIVE	1	OUT Token Received When Endpoint Disabled																													
F	RW	STSPHSERCVD			Status Phase Received for Control Write (StsPhseRcvd)																													
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																													
			INACTIVE	0	No Status Phase Received for Control Write																													
			ACTIVE	1	Status Phase Received for Control Write																													
G	RW	BACK2BACKSETUP			Back-to-Back SETUP Packets Received (Back2BackSETup)																													
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																													
			INACTIVE	0	No Back-to-Back SETUP Packets Received																													
			ACTIVE	1	Back-to-Back SETUP Packets Received																													
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																													
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																													
			INACTIVE	0	No OUT Packet Error																													
			ACTIVE	1	OUT Packet Error																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
K	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No BbleErr interrupt																													
			ACTIVE	1	BbleErr interrupt																													
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No NAK interrupt																													
			ACTIVE	1	NAK Interrupt																													
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No NYET interrupt																													
			ACTIVE	1	NYET Interrupt																													
N	RW	STUPPKTRCVD			Setup Packet Received																													
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																													
			NOTRCVD	0	No Setup packet received																													
			RCVD	1	Setup packet received

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERSIZE			Transfer Size (XferSize)																													
					Indicates the transfer size in bytes for the endpoint. The core interrupts the application only after it has exhausted the transfer size amount of data. The transfer size can be Set to the maximum packet size of the endpoint, to be interrupted at the end of each packet. The core decrements this field every time a packet is read from the RxFIFO and written to the external memory.																													
B	RW	PKTCNT			Packet Count (PktCnt)																													
					This field is decremented to zero after a packet is written into the RxFIFO.																													
C	R	RXDPID			RxDPID																													
					Applies to isochronous OUT endpoints only. This is the data PID received in the last packet for this endpoint. SETUP Packet Count (SUPCnt) Applies to control OUT Endpoints only. This field specifies the number of back-to-back SETUP data packets the endpoint can receive.																													
			DATA0	0	DATA0																													
			DATA2PACKET1	1	DATA2 or 1 packet																													
			DATA1PACKET2	2	DATA1 or 2 packets																													
			MDATAPACKET3	3	MDATA or 3 packets

ID	R/W	Field	Value ID	Value	Description
A	RW	MPS			Maximum Packet Size (MPS)
					The application must program this field with the maximum packet size for the current logical endpoint. This value is in bytes.
B	RW	USBACTEP			USB Active Endpoint (USBActEP)
					Indicates whether this endpoint is active in the current configuration and interface. The core clears this bit for all endpoints (other than EP 0) after detecting a USB reset. After receiving the SetConfiguration and SetInterface commands, the application must program endpoint registers accordingly and set this bit.
			DISABLED	0	Not Active
			ENABLED	1	USB Active Endpoint
C	R	DPID			Endpoint Data PID (DPID)
					Applies to interrupt/bulk IN and OUT endpoints only. Contains the PID of the packet to be received or transmitted on this endpoint. The application must program the PID of the first packet to be received or transmitted on this endpoint, after the endpoint is activated. The applications use the SetD1PID and SetD0PID fields of this register to program either DATA0 or DATA1 PID. This field is applicable for both Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. Even/Odd (Micro)frame (EO_FrNum) In non-Scatter/Gather DMA mode: - Applies to isochronous IN and OUT endpoints only. - Indicates the (micro)frame number in which the core transmits/receives isochronous data for this endpoint. The application must program the even/odd (micro)frame number in which it intends to transmit/receive isochronous data for this endpoint using the SetEvFr and SetOddFr fields in this register. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is provided in the transmit descriptor structure. The frame in which data is received is updated in receive descriptor structure.
			INACTIVE	0	Endpoint Data PID not active
			ACTIVE	1	Endpoint Data PID active
D	R	NAKSTS			NAK Status (NAKSts)
					Indicates the following: When either the application or the core sets this bit: - The core stops receiving any data on an OUT endpoint, even if there is space in the RxFIFO to accommodate the incoming packet. - For non-isochronous IN endpoints: The core stops transmitting any data on an IN endpoint, even if there data is available in the TxFIFO. - For isochronous IN endpoints: The core sends out a zero-length data packet, even if there data is available in the TxFIFO. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.
			NONNAK	0	The core is transmitting non-NAK handshakes based on the FIFO status
			NAK	1	The core is transmitting NAK handshakes on this endpoint
E	RW	EPTYPE			Endpoint Type (EPTYPE)
					This is the transfer type supported by this logical endpoint.
			CONTROL	0	Control
			ISOCHRONOUS	1	Isochronous
			BULK	2	Bulk
			INTERRUPT	3	Interrupt

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
F	RW	STALL			STALL Handshake (Stall)																													
					Applies to non-control, non-isochronous IN and OUT endpoints only. The application sets this bit to stall all tokens from the USB host to this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Only the application can clear this bit, never the core. Applies to control endpoints only. The application can only set this bit, and the core clears it, when a SETUP token is received for this endpoint. If a NAK bit, Global Non-periodic IN NAK, or Global OUT NAK is set along with this bit, the STALL bit takes priority. Irrespective of this bit's setting, the core always responds to SETUP data packets with an ACK handshake.																													
			INACTIVE	0	STALL All non-active tokens																													
			ACTIVE	1	STALL All Active Tokens																													
G	W	CNAK			Clear NAK (CNAK) A write to this bit clears the NAK bit for the endpoint.																													
			INACTIVE	0	No Clear NAK																													
			ACTIVE	1	Clear NAK																													
H	W	SNAK			Set NAK (SNAK)																													
					A write to this bit sets the NAK bit for the endpoint. Using this bit, the application can control the transmission of NAK handshakes on an endpoint. The core can also set this bit for an endpoint after a SETUP packet is received on that endpoint.																													
			INACTIVE	0	No Set NAK																													
			ACTIVE	1	Set NAK																													
I	W	SETD0PID			Set DATA0 PID (SetD0PID)																													
					- Applies to interrupt/bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA0. - This field is applicable both for Scatter/Gather DMA mode and non-Scatter/Gather DMA mode. In non-Scatter/Gather DMA mode: Set Even (micro)frame (SetEvenFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the Even/Odd (micro)frame (EO_FrNum) field to even (micro)frame. - When Scatter/Gather DMA mode is enabled, this field is reserved. The frame number in which to send data is in the transmit descriptor structure. The frame in which to receive data is updated in receive descriptor structure.																													
			DISABLED	0	Disables Set DATA0 PID or Do not force Even Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA0 or Sets EO_FrNum field to odd (micro)Frame																													
J	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd (micro)Frame

Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
J	W	SETD1PID			Set DATA1 PID (SetD1PID)																													
					- Applies to interrupt and bulk IN and OUT endpoints only. - Writing to this field sets the Endpoint Data PID (DPID) field in this register to DATA1. - This field is applicable both for scatter-gather DMA mode and non scatter-gather DMA mode. Set Odd (micro)frame (SetOddFr) - Applies to isochronous IN and OUT endpoints only. - Writing to this field sets the even and odd (micro)frame (EO_FrNum) field to odd (micro)frame.																													
			DISABLED	0	Disables Set DATA1 PID or Do not force Odd Frame																													
			ENABLED	1	Set Endpoint Data PID to DATA1 or Sets EO_FrNum field to odd (micro)Frame																													
K	RW	EPDIS			Endpoint Disable (EPDis)																													
					Applies to IN and OUT endpoints. The application sets this bit to stop transmitting/receiving data on an endpoint, even before the transfer for that endpoint is complete. The application must wait for the Endpoint Disabled interrupt before treating the endpoint as disabled. The core clears this bit before setting the Endpoint Disabled interrupt. The application must set this bit only if Endpoint Enable is already set for this endpoint.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Disable Endpoint																													
L	RW	EPENA			Endpoint Enable (EPEna)																													
					Applies to IN and OUT endpoints. When Scatter/Gather DMA mode is enabled, - For IN endpoints this bit indicates that the descriptor structure and data buffer with data ready to transmit is setup. - For OUT endpoint it indicates that the descriptor structure and data buffer to receive data is setup. When Scatter/Gather DMA mode is enabled such as for buffer-pointer based DMA mode: - For IN endpoints, this bit indicates that data is ready to be transmitted on the endpoint. - For OUT endpoints, this bit indicates that the application has allocated the memory to start receiving data from the USB. The core clears this bit before setting any of the following interrupts on this endpoint: - SETUP Phase Done - Endpoint Disabled - Transfer Completed Note: For control endpoints in DMA mode, this bit must be set for the controller to transfer SETUP data packets to the memory. This bit is not cleared on Transfer Completed interrupt of the SETUP packet.																													
			INACTIVE	0	No Action																													
			ACTIVE	1	Enable Endpoint

Device OUT Endpoint Interrupt Register 14

This register contains the interrupts for the OUT Endpoint 14 of the Device controller.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID			N M L K J I H G F E D C B A																															
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	XFERCOMPL			Transfer Completed Interrupt (XferCompl)																													
					Applies to IN and OUT endpoints. - When Scatter/Gather DMA mode is enabled -- For IN endpoint this field indicates that the requested data from the descriptor is moved from external system memory to internal FIFO. -- For OUT endpoint this field indicates that the requested data from the internal FIFO is moved to external system memory. This interrupt is generated only when the corresponding endpoint descriptor is closed, and the IOC bit for the corresponding descriptor is Set. - When Scatter/Gather DMA mode is disabled, this field indicates that the programmed transfer is complete on the AHB as well as on the USB, for this endpoint.																													
			INACTIVE	0	No Transfer Complete Interrupt																													
			ACTIVE	1	Transfer Complete Interrupt																													
B	RW	EPDISBLD			Endpoint Disabled Interrupt (EPDisbld)																													
					Applies to IN and OUT endpoints. This bit indicates that the endpoint is disabled per the application's request.																													
			INACTIVE	0	No Endpoint Disabled Interrupt																													
			ACTIVE	1	Endpoint Disabled Interrupt																													
C	RW	AHBERR			AHB Error (AHBErr)																													
					Applies to IN and OUT endpoints. This is generated only in Internal DMA mode when there is an AHB error during an AHB read/write. The application can read the corresponding endpoint DMA address register to get the error address. For details, see "AHB Error Handling" section in the Programming Guide.																													
			INACTIVE	0	No AHB Error Interrupt																													
			ACTIVE	1	AHB Error interrupt																													
D	RW	SETUP			SETUP Phase Done (SetUp)																													
					Applies to control OUT endpoints only. Indicates that the SETUP phase for the control endpoint is complete and no more back-to-back SETUP packets were received for the current control transfer. On this interrupt, the application can decode the received SETUP data packet.																													
			INACTIVE	0	No SETUP Phase Done																													
			ACTIVE	1	SETUP Phase Done																													
E	RW	OUTTKNEPDIS			OUT Token Received When Endpoint Disabled (OUTTKnEPdis)																													
					Applies only to control OUT endpoints. Indicates that an OUT token was received when the endpoint was not yet enabled. This interrupt is asserted on the endpoint for which the OUT token was received.																													
			INACTIVE	0	No OUT Token Received When Endpoint Disabled																													
			ACTIVE	1	OUT Token Received When Endpoint Disabled																													
F	RW	STSPHSERCVD			Status Phase Received for Control Write (StsPhseRcvd)																													
					This interrupt is valid only for Control OUT endpoints. This interrupt is generated only after the core has transferred all the data that the host has sent during the data phase of a control write transfer, to the system memory buffer. The interrupt indicates to the application that the host has switched from data phase to the status phase of a Control Write transfer. The application can use this interrupt to ACK or STALL the Status phase, after it has decoded the data phase.																													
			INACTIVE	0	No Status Phase Received for Control Write																													
			ACTIVE	1	Status Phase Received for Control Write																													

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
G	RW	BACK2BACKSETUP			Back-to-Back SETUP Packets Received (Back2BackSETup)																													
					Applies to Control OUT endpoints only. This bit indicates that the core has received more than three back-to-back SETUP packets for this particular endpoint. For information about handling this interrupt, refer to Programming guide section "Handling More Than Three Back-to-Back SETUP Packets". This bit is not valid in Completer mode.																													
			INACTIVE	0	No Back-to-Back SETUP Packets Received																													
			ACTIVE	1	Back-to-Back SETUP Packets Received																													
H	RW	OUTPKTERR			OUT Packet Error (OutPktErr)																													
					Applies to OUT endpoints Only This interrupt is valid only when thresholding is enabled. This interrupt is asserted when the core detects an overflow or a CRC error for non-Isochronous OUT packet.																													
			INACTIVE	0	No OUT Packet Error																													
			ACTIVE	1	OUT Packet Error																													
I	RW	BNAINTR			BNA (Buffer Not Available) Interrupt (BNAIntr)																													
					This bit is valid only when Scatter/Gather DMA mode is enabled. The core generates this interrupt when the descriptor accessed is not ready for the Core to process, such as Host busy or DMA done																													
			INACTIVE	0	No BNA interrupt																													
			ACTIVE	1	BNA interrupt																													
J	RW	PKTDRPSTS			Packet Drop Status (PktDrpSts)																													
					This bit indicates to the application that an ISOC OUT packet has been dropped. This bit does not have an associated mask bit and does not generate an interrupt. Dependency: This bit is valid in non Scatter/Gather DMA mode when periodic transfer interrupt feature is selected.																													
			INACTIVE	0	No interrupt																													
			ACTIVE	1	Packet Drop Status interrupt																													
K	RW	BBLEERR			NAK Interrupt (BbleErr)																													
					The core generates this interrupt when babble is received for the endpoint.																													
			INACTIVE	0	No BbleErr interrupt																													
			ACTIVE	1	BbleErr interrupt																													
L	RW	NAKINTRPT			NAK Interrupt (NAKInterrupt)																													
					The core generates this interrupt when a NAK is transmitted or received by the device. In case of isochronous IN endpoints the interrupt gets generated when a zero length packet is transmitted due to un-availability of data in the TXFifo.																													
			INACTIVE	0	No NAK interrupt																													
			ACTIVE	1	NAK Interrupt																													
M	RW	NYETINTRPT			NYET Interrupt (NYETIntrpt)																													
					The core generates this interrupt when a NYET response is transmitted for a non isochronous OUT endpoint.																													
			INACTIVE	0	No NYET interrupt																													
			ACTIVE	1	NYET Interrupt

ID	R/W	Field	Value ID	Value	Description																														
N	RW	STUPPKTRCVD			Setup Packet Received																														
					Applicable for Control OUT Endpoints in only in the Buffer DMA Mode Set by the controller, this bit indicates that this buffer holds 8 bytes of setup data. There is only one Setup packet per buffer. On receiving a Setup packet, the controller closes the buffer and disables the corresponding endpoint. The application has to re-enable the endpoint to receive any OUT data for the Control Transfer and reprogram the buffer start address. Note: Because of the above behavior, the controller can receive any number of back to back setup packets and one buffer for every setup packet is used.																														
			NOTRCVD	0	No Setup packet received																														
			RCVD	1	Setup packet received

Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value								Description																							

A	RW	DMAADDR			Holds the start address of the external memory for storing or fetching endpoint data. Note: For control endpoints, this field stores control OUT data packets as well as SETUP transaction data packets. When more than three SETUP packets are received back-to-back, the SETUP data packet in the memory is overwritten. This register is incremented on every AHB transaction. The application can give only a DWORD-aligned address. - When Scatter/Gather DMA mode is not enabled, the application programs the start address value in this field. - When Scatter/Gather DMA mode is enabled, this field indicates the base pointer for the descriptor list.

					The application programs Ignore_CtlOUT_DATA0_dis=1 to disable the device controller from reporting transaction error when DATA0 PID is received from host for the first Control OUT Data Phase and Control Status OUT phase. This bit must be programmed during the initial configuration of the controller and must not be modified later.																													
			ENABLEFIX	0	Transaction Error reported when host sends DATA0 PID																													
			DISABLEFIX	1	Transaction Error not reported when host sends DATA0 PID																													
D	RW	SSPLITSTALLNYETERRDIS			Disable the STAR fix added for Host controller to flag error for SSPLIT STALL/ NYET																													
					The application programs SSPLIT_STALLNYET_Err_dis=1 to disable the host controller from reporting transaction error for STALL/NYET received from device for SSPLIT transfer. This bit must be programmed during the initial configuration of the controller and must not be modified later.																													
			ENABLEFIX	0	Transaction Error reported when device sends STALL/NYET for SSPLIT																													
			DISABLEFIX	1	Transaction Error not reported when device sends STALL/NYET for SSPLIT																													
E	RW	ACCEPTISOCSPPLITDATA1DIS			Disable the STAR fix added for Host controller to accept DATA1 PID from device for ISOC Split transfers																													
					The application programs Accept_Isoc_split_DATA1_dis=1 to disable the host controller from accepting DATA1 PID from device for ISOC Split transfers. This bit must be programmed during the initial configuration of the controller and must not be modified later.																													
			ENABLEFIX	0	Transaction Error not reported when device sends DATA1 PID for ISOC Split																													
			DISABLEFIX	1	Transaction Error reported when device sends DATA1 PID for ISOC Split																													
F	RW	HANDLEFAULTYCABLEDIS			Disable the STAR fix added for Host controller to handle Faulty cable scenarios																													
					The application programs HandleFaultyCable_dis=1 to disable the host controller from reporting Port Babble error when the linestate is stuck at 1 (in FS mode) or 2 (in LS mode) due to a Faulty cable. This bit must be programmed during the initial configuration of the controller and must not be modified later.																													
			ENABLEFIX	0	Fix for handling faulty cable enabled																													
			DISABLEFIX	1	Fix for handling faulty cable disabled																													
G	RW	LSIPGINCRDIS			Disable the STAR fix added for Host controller LS mode IPG increment from 2 LS bit times to 3 LS bit times																													
					The application programs LS_IPG_incr_dis=1 to disable the IPG increment from 2 to 3 LS bit times when host controller is operating in LS mode. This bit must be programmed during the initial configuration of the controller and must not be modified later.																													
			ENABLEFIX	0	Host LS mode IPG is 3 LS bit times																													
			DISABLEFIX	1	Host LS mode IPG is 2 LS bit times																													
H	RW	FSDISCIDLEDIS			Disable the STAR fix added for Device controller to transition to IDLE state during FS device disconnect																													
					The application programs FSDisc_Idle_dis=1 to disable the Transmit/ Receive state machine from moving to IDLE state when FS device disconnect happens. This bit must be programmed during the initial configuration of the controller and must not be modified later.																													

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID	R/W	Field	Value ID	Value	Description																																	
I	RW	CONCURRENTRMTWKUPUSBRESUMEDIS	ENABLEFIX	0	Device controller transitions to IDLE state during FS device disconnect																																	
			DISABLEFIX	1	Device controller does not transition to IDLE state during FS device disconnect																																	
			Disable the STAR fix added for Device controller to not start Remote Wakeup signalling when USB resume has already started																																			
			The application programs Concurrent_Rmtwkup_USBResume_dis=1 to allow the controller to do remote wakeup signalling when USB resume has already started from the Host. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																			
J	RW	LSIPGCHKAFTERNAKSTALLFORINDIS	ENABLEFIX	0	Device controller does not start remote wakeup signalling when host resume has already started																																	
			DISABLEFIX	1	Device controller is allowed to start remote wakeup signalling when host resume has already started																																	
			Disable the STAR fix added for Host controller to wait for IPG duration to send next token after receiving NAK/STALL for previous IN token with FS/LS device																																			
			The application programs LS_IPG_chk_after_NAK_STALL_for_IN_dis=1 to allow the controller to send the next token without waiting for the interpacket gap duration after receiving a NAK/STALL from device for the previous IN token. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																			
K	RW	PHYIOPXCVRSELTXVLDCORRDIS	ENABLEFIX	0	Host controller checks IPG after NAK/STALL for IN token																																	
			DISABLEFIX	1	Host controller does not check IPG after NAK/STALL for IN token																																	
			Disable the STAR fix added for Host controller to increase the gap between utmi_xcvrselect switching and utmi_txvalid assertion in LS/FS mode																																			
			The application programs PHY_IOP_xcvrsel_txvld_corr_dis=1 to allow the controller to assert utmi_txvalid 1 cycle after the utmi_xcvrselect switching. This can cause interop issues with SNPS PHY which requires at least 2 cycles of gap between the utmi_xcvrselect switch and the utmi_txvalid assertion. Hence it is recommended to program PHY_IOP_xcvrsel_txvld_corr_dis=0. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																			
			ENABLEFIX	0	Host controller asserts utmi_txvalid at least 2 utmi_clk cycles after utmi_xcvrselect switching																																	
			DISABLEFIX	1	Host controller can assert utmi_txvalid after 1 utmi_clk cycle of utmi_xcvrselect switching																																	

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																													
L	RW	ULPIXCVRSELSWITCHCORRDIS			Disable the STAR fix added for Host controller to increase the preamble transceiver select switch delay to accommodate time taken for ULPI function control write																													
					The application programs ULPI_xcvrsel_switch_corr_dis=1 to allow the controller to do back to back transceiver select switching within the duration required for a single ULPI function control write (around 5-6 ulpi_clk cycles). This can cause a corrupted packet to go on the bus since the ULPI wrapper may not be able to do the second ULPI functional update (register write) correctly. Hence it is recommended to program ULPI_xcvrsel_switch_corr_dis=0. With ULPI_xcvrsel_switch_corr_dis=0, the delay between transceiver select switch and txvalid assertion has also been increased for FS/LS mode to resolve PHY interop issues. This bit must be programmed during the initial configuration of the controller and must not be modified later.																													
			ENABLEFIX	0	Host controller waits for previous functional register update to complete before switching the transceiver select again or asserting txvalid																													
			DISABLEFIX	1	Host controller does not wait for the previous functional register update to complete before switching the transceiver select again or asserting txvalid																													
M	RW	XACTERRDATA0CTRLSTSINDIS			Disable the STAR fix added for Host controller to report transaction error when DATA0 PID is received for CTRL STATUS IN transfer in DMA mode																													
					The application programs XactErr_DATA0_CTRL_STS_IN_dis=1 to allow the controller to respond with ACK for the incorrect DATA0 PID and then retry the control STATUS IN transfer until DATA1 PID is received. With XactErr_DATA0_CTRL_STS_IN_dis=0, the controller generates Transaction Error interrupt when the incorrect PID is received. This STAR fix is applicable only for Buffer DMA and Descriptor DMA modes. This bit must be programmed during the initial configuration of the controller and must not be modified later.																													
			ENABLEFIX	0	Host controller reports transaction error when DATA0 PID is received for CTRL STATUS IN transfer in DMA mode																													
			DISABLEFIX	1	Host controller retries the transfer when DATA0 PID is received for CTRL STATUS IN transfer in DMA mode																													
N	RW	HOSTUTMITXVLCORRDIS			Disable the correction to OpMode/XcvrSel/TermSel on UTMI Interface in Host mode.																													
					When HPRT.PrtRst is set by the application, the Host controller can change the Opmode, XcvrSel and TermSel while TxValid is still high (1'b1) during SOF transmission in 8-bit UTMI mode. This behavior of the controller has been corrected to handle port reset during SOF transmission. With the fix, the controller waits for Txvalid to go low (1'b0) and then changes the OpMode, XcvrSel and TermSel. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																													
			ENABLEFIX	0	Opmode, XcvrSel, TermSel are changed by the Host Controller after TxValid goes LOW (1'b0)																													
			DISABLEFIX	1	Opmode, XcvrSel, TermSel are changed by the Host Controller without waiting for TxValid to go LOW (1'b0) during SOF transmission																													

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID	R/W	Field	Value ID	Value	Description																																	
O	RW	OPMODEXCVRSELCHIRPENCCORRDIS			Disable the STAR fix added for correcting Opmode and XcwrSel on UTMI Interface when reset is detected in suspend state.																																	
					In configurations with Battery charger support enabled (and GOTGCTL.ChirpEn programmed to 1), the RTL has been updated to wait for 1ms and then change the opmode and xcwrselect when reset is detected in the suspend state. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller and change Opmode and XcwrSel without waiting for 1ms after reset detection. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			ENABLEFIX	0	Valid Combination of Opmode and XcwrSel is driven when reset is detected in suspend state																																	
			DISABLEFIX	1	Invalid Combination of Opmode and XcwrSel is driven when reset is detected in suspend state																																	
P	RW	TXVALIDDEASSERTIONCORRDIS			Disable the STAR fix added for correcting Txvalid deassertion on UTMI Interface when soft disconnect is done.																																	
					The RTL has been updated to wait for utmi_txready and then de-assert the utmi_txvalid being driven by MAC DSSR when soft disconnect is done. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller and change Txvalid without waiting for Txready. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			ENABLEFIX	0	Txvalid is deasserted during soft disconnect after receiving Txready from the PHY																																	
			DISABLEFIX	1	Txvalid is deasserted during soft disconnect without waiting for Txready from the PHY																																	
Q	RW	HOSTNOXFERAFTERPRTDISFIXDIS			Disable the STAR fix added for correcting Host behavior when port is disabled.																																	
					The RTL has been updated to not assert utmi_txvalid when the port is disabled. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			ENABLEFIX	0	Txvalid is not asserted when port is disabled																																	
			DISABLEFIX	1	Txvalid can be asserted when port is disabled																																	
R	RW	LINESTATESE0FILTERFOREOPDIS			Disable the STAR fix added for filtering SE0 from the linestate during EOP detection..																																	
					The RTL has been updated to filter glitches occurred in the linestate. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			ENABLEFIX	0	Filter for linestate is enabled																																	
			DISABLEFIX	1	Filter for linestate is not enabled																																	

Bit number					31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID	R/W	Field	Value ID	Value	Description																																	
S	RW	DMPULLDOWNUPDATEINOTGFORHIBANDPP			Disable the STAR fix added for utmiotg_dmpulldown update in Hibernation and Partial power down modes.																																	
					The RTL has been updated for OTG mode to remove the glitch in utmiotg_dmpulldown signal while controller is exiting from Hibernation or Partial power down. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			ENABLEFIX	0	utmiotg_dmpulldown logic for hiberabtion and partial power down is enabled																																	
			DISABLEFIX	1	utmiotg_dmpulldown logic for hiberabtion and partial power down is not enabled																																	
T	RW	CHIRPDETECTIONUPDTHSTDIS			Disable the Chirp detection logic change in host mode.																																	
					The RTL has been updated in Host mode to avoid the unexpected chirp detection when there is no chirp K from device. After the RTL fix chirp detection logic depends on the delayed WAIT_CHIRP state. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			ENABLEFIX	0	Chirp detection logic in MAC PRT module depends on the delayed WAIT_CHIRP state and only valid chirp K from device is detected																																	
			DISABLEFIX	1	Chirp detection logic depends on the WAIT_CHIRP state and controller might detect false chirp K from device																																	
U	RW	PROGRAMMABLESE0DURATIONTODETECTEOP			Disable the STAR fix added for programmable se0 duration to detect EOP in Host mode .																																	
					The RTL Enhancement has been done to reduce the EOP SEO detection time for USB2 SOF,transmitted by the core to work with longer cables and/ or devices with longer delays. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			ENABLEFIX	0	Programmable se0 duration to detect EOP in Host mode is enabled																																	
			DISABLEFIX	1	Programmable se0 duration to detect EOP in Host mode is disabled																																	
V	RW	ENABLELEVELSYNCHRONISERFORH2PDTXF			Disable the STAR fix added for h2pd_txf_0len_pkt signal which is passing through a level synchronizer.																																	
					Dummy synchronizer of h2pd_txf_0len_pkt signal has been replaced with Level synchronizer. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			ENABLEFIX	0	level synchroniser for h2pd_txf_0len_pkt is enabled and disabled dummy synchronizer																																	
			DISABLEFIX	1	level synchroniser for h2pd_txf_0len_pkt is disabled and connected through dummy synchronizer																																	

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID	R/W	Field	Value ID	Value	Description																																	
W	RW	EUSB2TERMINATERESUMEONDISCDIS			Disable fix for Terminating Resume if UTMI HostDisconnect is detected.																																	
			ENABLEFIX	0	The RTL has been updated in Host mode to terminate Resume if UTMI HostDisconnect is asserted, this is to avoid the controller and PHY from being out of sync if HostDisconnect coincides with the beginning of Resume transmission. The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			DISABLEFIX	1	Host controller terminates Resume if HostDisconnect is asserted																																	
					Host controller does not terminate Resume if HostDisconnect is asserted																																	
X	RW	EUSB2FSLSDISCDTECTIONDIS			Disable fix for FS/LS disconnect detection using UTMI HostDisconnect in MAC PRT.																																	
					The RTL has been updated in Host mode to detect disconnect using the utmi_hostdisconnect signal instead of monitoring 2.5us of SE0 on DP/DM.																																	
			ENABLEFIX	0	The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			DISABLEFIX	1	Host controller detects FS/LS disconnect using utmi_hostdisconnect signal																																	
					Host controller detects disconnect by monitoring 2.5us of SE0 on DP/DM																																	
Y	RW	HOSTFLUSHEXCESSTKNFIXDIS			Disable fix for recovering the Host controller when sufficient time is not available in the current uF for an overscheduled ISOC OUT or INTR IN transfer.																																	
			ENABLEFIX	0	The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			DISABLEFIX	1	Host controller functionality is as expected if there is an overscheduled ISOC OUT or INTR IN transfer																																	
					Host controller functionality cannot be determined if there is an overscheduled ISOC OUT or INTR IN transfer																																	
Z	RW	TITRANSDONETGLDURINGISOC EOPFDISAB			Disable the fix added to not toggle ti_trans_done in SEND_EOP state when the ISOC in tokens responds with zero length packets after end of periodic frame till next start of frame. The fix is added when operating in descriptor dma device mode.																																	
			ENABLEFIX	0	The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			DISABLEFIX	1	ti_transdone is not toggled after eopf during ISOC IN transfer till next SOF																																	
					ti_transdone is toggled after eopf during ISOC IN transfer till next SOF																																	
a	RW	CLEARSOFRFCLKTIMERDURINGDISC			Disable the STAR fix added to clear the SOF refclk timer during disconnect detection. The STAR fix is added when using both UTMI and eUSB2 PHY.																																	
			ENABLEFIX	0	The application can set this register bit to 1'b1 to fall back to the original behavior of the controller. This bit must be programmed during the initial configuration of the controller and must not be modified later.																																	
			DISABLEFIX	1	SOF refclk timer is cleared immediately after device disconnect is detected.																																	
					SOF refclk timer is not cleared immediately after device disconnect is detected.

8.28 VPR — RISC-V CPU

VPR is a small, efficient CPU developed by Nordic Semiconductor.

The VPR implementation is the Fast Lightweight Peripheral Processor (FLPR), optimized to implement coprocessor functions, and operating at the same frequency as the application processor.

VPR is compatible with the RISC-V instruction set and implements the following extensions:

- E – Integer instruction set with 16 registers
- M – Multiply and divide extension
- C – Compressed extension (compressed instructions)

VPR implements the machine mode CPU mode as well as the RISC-V CLIC specification for the interrupt controller.

VPR does not start on its own, but must be started by the application core processor by performing the following steps:

1. Configure VPR program counter (PC) to point to the peripheral binary image by using register [INITPC](#) on page 1123.
2. Start VPR by using register [CPURUN](#) on page 1122.

8.28.1 VPR registers

Instances

8.28.1.13 DEBUGIF.HARTINFO

Address offset: 0x448

Hart Information

This register gives information about the hart currently selected by hartsel. This register is optional. If it is not present it should read all-zero. If this register is included, the debugger can do more with the Program Buffer by writing programs which explicitly access the data and/or dscratch registers

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				D D D D C B B B A A A A A A A A A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	R	DATAADDR		-2048 .. 2047	Data Address																														
					If dataaccess is 0: The number of the first CSR dedicated to shadowing the data registers. If dataaccess is 1: Address of RAM where the data registers are shadowed. This address is sign extended and easily addressed with a load or store using x0 as the address register.																														
B	R	DATASIZE		0 .. 12	Data Size																														
					If dataaccess is 0: Number of CSRs dedicated to shadowing the data registers. If dataaccess is 1: Number of 32-bit words in the memory map dedicated to shadowing the data registers. Since there are at most 12 data registers, the value in this register must be 12 or smaller																														
C	R	DATAACCESS			Data Access																														
			No	0	The data registers are shadowed in the hart by CSRs. Each CSR is DXLEN bits in size, and corresponds to a single argument.																														
			Yes	1	The data registers are shadowed in the hart’s memory map. Each register takes up 4 bytes in the memory map.																														
D	R	NSCRATCH			Number of dscratch registers																														
					Number of dscratch registers available for the debugger to use during program buffer execution, starting from dscratch0. The debugger can make no assumptions about the contents of these registers between commands.																														

8.28.1.14 DEBUGIF.HALTSUM1

Address offset: 0x44C

Halt Summary 1

Each bit in this read-only register indicates whether any of a group of harts is halted or not. Unavailable/nonexistent harts are not considered to be halted. This register might not be present if fewer than 33 harts are connected to this DM. The LSB reflects the halt status of harts hartsel[19:10] 0x0 through 0x1f. The MSB reflects the halt status of harts hartsel[19:10] 0x3e0 through 0x3ff.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

A	R	HAWINDOWSEL						The high bits of this field may be tied to 0, depending on how large the array mask register is. E.g. on a system with 48 harts only bit 0 of this field may actually be writable.																											

8.28.1.16 DEBUGIF.HAWINDOW

Address offset: 0x454

Hart Array Window

This register provides R/W access to a 32-bit portion of the hart array mask register. The position of the window is determined by hawindowssel. I.e. bit 0 refers to hart hawindowssel x 32, while bit 31 refers to hart hawindowssel x 32 + 31. Since some bits in the hart array mask register may be constant 0, some bits in this register may be constant 0, depending on the current value of hawindowssel.

8.28.1.19 DEBUGIF.ABSTRACTAUTO

Address offset: 0x460

Abstract Command Autoexec

This register is optional. Including it allows more efficient burst accesses. A debugger can detect whether it is support by setting bits and reading them back. Writing this register while an abstract command is executing causes cmderr to become 1 (busy) once the command completes (busy becomes 0).

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

8.28.1.20 DEBUGIF.CONFSTRPTR[n] (n=0..3)

Address offset: 0x464 + (n × 0x4)

Configuration String Pointer [n]

When confstrptrvalid is set, reading this register returns bits 31:0 of the configuration string pointer. Reading the other confstrptr registers returns the upper bits of the address. When system bus mastering is implemented, this must be an address that can be used with the System Bus Access module. Otherwise, this must be an address that can be used to access the configuration string from the hart with ID 0.32 RISC-V External Debug Support Version 0.13.2 If confstrptrvalid is 0, then the confstrptr registers hold identifier information.

8.28.1.22 DEBUGIF.PROGBUF[n] (n=0..15)

Address offset: 0x480 + (n × 0x4)

Program Buffer [n]

progbuf0 through progbuf15 provide read/write access to the optional program buffer. progbufsize indicates how many of them are implemented starting at progbuf0, counting up. Accessing these registers while an abstract command is executing causes cmderr to be set to 1 (busy) if it is 0. Attempts to write them while busy is set does not change their value. The values in these registers may not be preserved after an abstract command is executed. The only guarantees on their contents are the ones offered by the command in question. If the command fails, no assumptions can be made about the contents of these registers.

Note: The VPR implements a single progbuf, all others (beyond progbuf0) are hardwired 0

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

8.28.1.31 DEBUGIF.SBDATA0

Address offset: 0x4F0

System Bus Data 31:0

If all of the sbaccess bits in sbcs are 0, then this register is not present. Any successful system bus read updates sbdata. If the width of the read access is less than the width of sbdata, the contents of the remaining high bits may take on any value. If either sberror or sbbusyerror isn't 0 then accesses do nothing. If the bus master is busy then accesses set sbbusyerror, and don't do anything else. Writes to this register start the following: 1. Set sbbusy. 2. Perform a bus write of the new value of sbdata to sbaddress. 3. If the write succeeded and sbautoincrement is set, increment sbaddress. 4. Clear sbbusy. Reads from this register start the following: 1. "Return" the data. 2. Set sbbusy. 3. If sbreadondata is set: (a) Perform a system bus read from the address contained in sbaddress, placing the result in sbdata. (b) If sbautoincrement is set and the read was successful, increment sbaddress. 4. Clear sbbusy. Only sbdata0 has this behavior. The other sbdata registers have no side effects. On systems that have buses wider than 32 bits, a debugger should access sbdata0 after accessing the other sbdata registers

			Disabled	0																															
H	R	X	Enabled	1																															
					Non-standard extensions present																														
					Indicates presence of standard non-standard extensions																														
			NotPresent	0																															
I	R	MXL	Present	1																															
					Machine XLEN																														
					Encodes the native base integer ISA width. The MXL field may be writable in implementations that support multiple base ISA widths. The effective XLEN in M-mode, MXLEN, is given by the setting of MXL, or has a fixed value if misa is zero. The MXL field is always set to the widest supported ISA variant at reset																														
			XLEN32	1	XLEN is 32 bits																														
			XLEN64	2	XLEN is 64 bits																														
XLEN128	3	XLEN is 128 bits																																	

8.28.3.3 MTVEC

Address offset: 0x305

Machine Trap-Vector

Holds trap vector configuration, consisting of a vector base address (BASE) and a vector mode (MODE)

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				B A A																															
Reset 0x00000003				0 1 1																															
ID	R/W	Field	Value ID	Value				Description																											
A	R	MODE						Mode																											
			CLIC	3				Core Local Interrupt Controller (CLIC) interrupt handling mode																											
B	RW	BASE						Vector base address																											
								The BASE field value must align on an 8-byte boundary																											

8.28.3.4 MTVT

Address offset: 0x307

Machine Trap Vector Table

Holds the base address of the trap vector table, aligned on a 64-byte or greater power-of-two boundary. The actual alignment can be determined by writing ones to the low-order bits then reading them back.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0x00000000				0 0

ID	R/W	Field	Value ID	Value				Description																											
A	R	MIL						M-Mode interrupt level																											

8.28.3.11 MINTTHRESH

Address offset: 0x347

M-mode Interrupt-level Threshold

Holds an 8-bit field for the threshold level of M-mode. Typical use is to implement critical sections. The current hart's effective interrupt level would then be: $\text{effective_level} = \max(\text{MINTSTATUS.MIL}, \text{MINTTHRESH.TH})$

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A A A A A A A																															
Reset 0x0000001F				0 0																															

DISABLED

0x0

Threshold disabled

Note: This can always be used to reset the threshold to the lowest supported level and let all interrupt levels through, even though it will not read back as this value afterwards.

THRESH1F

0x1F

Threshold level 0x1F

Note: This is the reset level, threshold disabled.

THRESH3F

0x3F

8.28.3.12 MCLICBASE

Address offset: 0x350

Machine CLIC Base

Provides the base address of CLIC memory mapped registers. Its value should be configured or set up at the platform level to indicate the starting address of CLIC memory mapped registers. Since the CLIC memory map must be aligned at a 4KiB boundary, the mclibase CSR has its 12 least-significant bits hardwired to zero. It is used to inform software about the location of CLIC memory mapped registers.

Bit number					31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset 0x40000003				0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1				
ID	R/W	Field	Value ID	Value	Description																																	
B	RW	STEP			Step																																	
					When set and not in Debug Mode, the hart will only execute a single instruction and then enter Debug Mode. If the instruction does not complete due to an exception, the hart will immediately enter Debug Mode before executing the trap handler, with appropriate exception registers set. The debugger must not change the value of this bit while the hart is running																																	
C	R	CAUSE			Debug Mode enter cause																																	
					When there are multiple reasons to enter Debug Mode in a single cycle, hardware should set cause to the cause with the highest priority. Values other than the following are reserved for future use																																	
			EBREAK	1	An ebreak instruction was executed. (priority 3)																																	
			TRIGGER	2	The Trigger Module caused a breakpoint exception. (priority 4, highest)																																	
			HALTREQ	3	The debugger requested entry to Debug Mode using haltreq. (priority 1)																																	
			STEP	4	The hart single stepped because step was set. (priority 0, lowest)																																	
			RESETHALTREQ	5	The hart halted directly out of reset due to resethaltreq. It is also acceptable to report 3 when this happens. (priority 2)																																	
D	RW	STEPIE			Step Interrupt Enable																																	
			Disabled	0	The debugger must not change the value of this bit while the hart is running																																	
			Enabled	1	Interrupts are disabled during single stepping																																	
					Interrupts are enabled during single stepping. Implementations may hard wire this bit to 0. In that case interrupt behavior can be emulated by the debugger.																																	
E	RW	EBREAKM			M-mode ebreak																																	
			SPEC	0	ebreak instructions in M-mode behave as described in the Privileged Spe																																	
			ENTERDBG	1	ebreak instructions in M-mode enter Debug Mode																																	
F	R	XDEBUGVER			External Debug version																																	
			STDDBG	4	External debug support exists as it is described in this document																																	

8.28.3.20 DPC

Address offset: 0x7B1

Debug PC

Upon entry to debug mode, dpc is updated with the virtual address of the next instruction to be executed. When resuming, the hart's PC is updated to the virtual address stored in dpc. A debugger may write dpc to change where the hart resumes

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

8.29 WDT — Watchdog timer

The countdown watchdog timer (WDT) uses the low-frequency clock source (LFCLK) and offers configurable and robust protection against application lock-up.

The main features of WDT are:

- Generates watchdog reset
- Optional pause of WDT when the CPU is sleeping or when it is stopped by the debugger
- Optional generation of non-maskable interrupt (NMI)
- Runs off the low-frequency clock source (LFCLK)

WDT must be configured before it is started. After configuration, WDT is started by triggering the START task.

When WDT is running, its configuration registers (CRV, RREN, and CONFIG) are blocked for further configuration.

WDT can be paused while the CPU is sleeping, or when the debugger has halted the CPU. WDT is implemented as a down-counter that generates a TIMEOUT event when it wraps over after counting down to 0. When WDT is started by the START task, the watchdog counter is loaded with the value specified in the CRV register. This counter is also reloaded with the value specified in the CRV register when a reload request is granted.

The timeout period for the watchdog is given by the following equation:

$$\text{timeout [s]} = (\text{CRV} + 1) / 32768$$

When started, WDT will make the 32.768 kHz RC oscillator start if no other 32.768 kHz clock source is running and generating the 32.768 kHz system clock, see chapter [CLOCK — Clock control](#) on page 72.

8.29.1 Reload criteria

WDT has eight separate reload request registers. These registers are used to request WDT to reload its counter with the value specified in the CRV register. To reload the watchdog counter, write 0x6E524635 to all enabled reload registers.

One or more RR registers can be individually enabled through the RREN register.

8.29.2 Temporarily pausing the watchdog

By default, the watchdog will be active counting down the down-counter while the CPU is sleeping. It is possible to configure the watchdog to automatically pause when the CPU is sleeping or when it is stopped by the debugger.

Entering System OFF mode will stop and disable the watchdog.

8.29.3 Watchdog reset

A TIMEOUT event automatically leads to a watchdog reset.

If the watchdog is configured to generate an interrupt on the TIMEOUT event, the watchdog reset is postponed by two 32.768 kHz clock cycles after the TIMEOUT event is generated. Once the TIMEOUT event is generated, and unless the watchdog is stopped, the impending watchdog reset will occur.

The watchdog can be reset from several reset sources, see [Reset behavior](#) on page 111. After a reset, the watchdog configuration registers are available for configuration.

See [RESET — Reset control](#) on page 109 for more information about reset sources.

The TIMEOUT event will also generate NMI interrupt, when NMI interrupt is supported. See the instance's configuration in [Instantiation](#) on page 232 to see if NMI is supported.

8.29.4 Stopping the watchdog

By default, the watchdog cannot be stopped. It is possible to configure the watchdog to allow the STOP task.

To stop the watchdog, perform the following steps.

1. Set the [CONFIG](#) register's STOPEN field to `Enable` during watchdog configuration.
2. Write the special value 0x6E524635 to the [TSEN](#) register.
3. Invoke the STOP task.

When these conditions are met, the watchdog is stopped and a STOPPED event is issued.

When the watchdog is stopped, its configuration registers [CRV](#), [RREN](#), and [CONFIG](#) are no longer blocked.

Note: It is recommended to write zeros to [TSEN](#) on page 1172 after the watchdog has stopped, to avoid runaway code triggering the STOP task.

8.29.5 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
WDT30	GLOBAL	0x50108000	HF	S	NA	No	Watchdog timer WDT30
WDT31 : S	GLOBAL	0x50109000	US	S	NA	No	Watchdog timer WDT31
WDT31 : NS		0x40109000					

Configuration

Instance	Domain	Configuration
WDT30	GLOBAL	Supports non-maskable interrupts (NMI).
WDT31 : S WDT31 : NS	GLOBAL	Does not generate non-maskable interrupts.

Register overview

Register	Offset	TZ	Description
TASKS_START	0x000		Start WDT

9 Debug and trace

The debug and trace system is a flexible and powerful mechanism for non-intrusive debugging.

The main features of the debug and trace system are the following:

- Access port connection for Arm Cortex-M33
 - Eight breakpoints
 - Four watchpoint comparators
 - Instrumentation trace macrocell (ITM)
 - Embedded trace macrocell (ETM)
 - Access protection through APPROTECT, SECUREAPPROTECT, and ERASEPROTECT
- Serial wire debug (SWD) interface, protocol version 2 with multidrop support
- Control-access port (CTRL-AP) that enables device control when other debug access ports (DAP) have been disabled by the access port protection
- Trace port interface unit (TPIU)
 - 4-bit parallel trace of ITM and ETM trace data
 - Serial wire output (SWO) trace of ITM data

Figure 175: Debug and trace overview

9.1 Debug access port

An external debugger can access the device through the debug access port (DAP).

The DAP implements a standard serial wire debug (SWD) Arm CoreSight protocol with a two-pin serial interface (**SWDCLK** and **SWDIO**).

The **SWDIO** pin has an internal pull-up resistor. The **SWDCLK** pin has an internal pull-down resistor.

There are several access ports for connecting to different parts of the system, as shown in the following table.

AP ID	Type	Description
0	AHB-AP	CM33 access port
1	AHB-AP	AUX access port
2	CTRL-AP	Control access port

Table 72: Access port overview

The AHB-AP is a standard Arm component. See the *ArmCoreSight SoC-400 Technical Reference Manual* for more information. The control access port (CTRL-AP) is proprietary and described in more detail in [CTRL-AP — Control access port](#) on page 1181.

9.1.1 Debug access port registers

Register overview

Register	Offset	TZ	Description
TARGETID	0x024		The TARGETID register provides information about the target when the host is connected to a single device. The TARGETID register is accessed by a read of DP register 0x4 when the DPBANKSEL bit in the SELECT register is set to 0x2.
DLPIDR	0x034		The DLPIDR register provides information about the serial wire debug protocol version. Accessed by a read of DP register 0x4 when the DPBANKSEL bit in the SELECT register is set to 0x3.

9.1.1.1 TARGETID

Address offset: 0x024

The TARGETID register provides information about the target when the host is connected to a single device.

The TARGETID register is accessed by a read of DP register 0x4 when the DPBANKSEL bit in the SELECT register is set to 0x2.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID	R/W	Field	Value ID	Value				Description																												
A	R	PROTVSN						Protocol version.																												
			SWDPv2	1				SW protocol version 2.																												
B	R	TINSTANCE						Target instance.																												

9.2 Access port protection

The access ports can be protected to secure the internal assets and resources of the device. While the control access port (CTRL-AP) is always accessible from an external debugger, the system applies various protection mechanisms to control and restrict access to the individual AHB access ports. These mechanisms ensure both secure and non-secure access can be selectively managed and protected.

Protection is controlled by specific registers, which enable or disable debug access at different levels. These registers are part of UICR and TAMPC. The access port is normally protected. The hardware and software configurations of these registers control the access protection policies as shown in the following table.

Registers	Description
UICR.APPROTECT	Hardware control of non-secure debug access. A device reset is required for this configuration to take effect. Unprotected – CPU controls DBGEN/NIDEN, locks disabled. Other values – DBGEN/NIDEN disabled and locked.
TAMPC.PROTECT.DOMAIN[0].DBGEN TAMPC.PROTECT.DOMAIN[0].NIDEN	CPU control of non-secure debug access. The registers can be locked.

Table 73: Non-secure Arm Cortex-M33 AHB-AP debug access

Registers	Description
UICR.SECUREAPPROTECT	Hardware control of secure debug access. A device reset is required for this configuration to take effect. Unprotected – CPU controls SPIDEN/SPNIDEN, locks disabled. Other values – SPIDEN/SPNIDEN disabled and locked.
TAMPC.PROTECT.DOMAIN[0].SPIDEN TAMPC.PROTECT.DOMAIN[0].SPNIDEN	CPU control of secure debug access. The registers can be locked. Non-secure invasive debug access must be enabled for secure debug access to be enabled.

Table 74: Secure Arm Cortex-M33 AHB-AP debug access

Registers	Description
UICR.AUXAPPROTECT	Hardware control of AUX-AP debug access. A device reset is required for this configuration to take effect. Unprotected – CPU controls AUX-AP DBGEN, lock disabled. Other values – AUX-AP DBGEN disabled and locked.
TAMPC.PROTECT.AP[0].DBGEN	Software control of AUX-AP debug access. The registers can be locked.

Table 75: VPR AUX-AP debug access

The access port protection is illustrated in the following figures.

Figure 176: AUX access port protection overview

Figure 177: Arm Cortex-M33 AHB-AP access port protection overview

Registers	Description
UICR.APPROTECT UICR.SECUREAPPROTECT	Hardware control of RRAMC ERASEALL protection in addition to access ports. A device reset is required for this configuration to take effect. Any value other than <code>Unprotected</code> disables RRAMC ERASEALL.
UICR.ERASEPROTECT	Hardware control of RRAMC ERASEALL and CTRL-AP ERASEALL protection. A device reset is required for this configuration to take effect. Any value other than <code>Unprotected</code> disables the erase all operations.
TAMPC.PROTECT.ERASEPROTECT	Software control of RRAMC ERASEALL and CTRL-AP ERASEALL protection. The register can be locked.

Table 76: Erase protection

The ERASEALL protection is illustrated in the following figure:

Figure 178: ERASEALL protection overview

The reset behavior of the TAMPC access port and ERASEALL protection is defined in [Signal protector](#) on page 209. On-chip software must write to the TAMPC registers before a debug access port is opened.

The access port remains open after the completion of the [CTRL-AP.ERASEALL](#) operation. CTRL-AP temporarily removes the access port protection until certain conditions are met, after which the protection will be reinstated. The AHB-AP will be protected when one of the following conditions are met:

- Power-on reset
- Brownout reset
- Watchdog timer reset
- Pin reset

The following figure shows how a device with access port protection enabled can be erased, programmed, and configured to allow debugging. The access port state is determined by operations sent from the debugger and registers written by firmware. Reset in the following figure refers to any of the conditions previously listed for AHB-AP protection. When writing to the TAMPC, the software must first disable write protection, then write the new values. For more details, see [TAMPC — Tamper controller](#) on page 206.

Figure 179: Access port unlocking

The debugger can read the access port protection status in the core's AHB-AP, using the Arm AHB-AP Control/Status Word register (CSW), defined in the *Arm CoreSight SoC-400 Technical Reference Manual*. The DbgStatus field indicates that the AHB-AP can perform AHB transfers, while the SPIStatus field indicates if secure AHB transfers are permitted. For a list of all debug access ports, see [Debug access port](#) on page 1174.

9.3 Debug Interface mode

Before the external debugger can connect to an access port, the debugger must first request the device to power up through the debug access port (SWJ-DP).

The device remains in Debug Interface mode when the debugger requests power through CxxxPWRUPREQ. CxxxPWRUPREQ refers to either CSYSPWRUPREQ or CDBGPWRUPREQ, and is further documented in the Arm debug interface architecture specification.

When not in Debug Interface mode, the device is in normal mode. When a debug session is over, the device must be set to normal mode by the external debugger, followed by a pin reset. This reduces overall power consumption.

Some peripherals behave differently in Debug Interface mode compared to normal mode. These differences are described in more detail in the corresponding peripheral chapter.

For details on how to use the debug capabilities, read the debug documentation of your IDE.

If the device is in System OFF when power is requested from CxxxPWRUPREQ, the system wakes up and the DIF flag in [RESETREAS](#) on page 112 is set.

9.4 Real-time debug

The device supports real-time debugging. This allows interrupts to execute to completion in real time when breakpoints are set in Thread mode or lower priority interrupts.

Real-time debugging enables setting a breakpoint for single-stepping through code. This prevents real-time event-driven threads from running at a higher priority. For example, this enables the device to continue to service high-priority interrupts of an external controller or sensor, without failure or loss of state synchronization, while stepping through code in a low-priority thread.

9.5 Multidrop serial wire debug

Multidrop serial wire debug (SWD) allows simultaneous access to an unlimited number of devices through a single connection. This is useful for connectivity-constrained products that have several chips with multidrop support.

To select a target in a multidrop capable product, the debugger must write the correct **TPARTNO**, and **TDESIGNER** fields into the SW-DP **TARGETSEL** register. Values for these fields are located in [DLPIDR](#) on page 1175.

For more information about multidrop SWD, see the *Arm Debug Interface Architecture Specification*, ADIv5.0 to ADIv5.2.

9.6 Trace

The device supports ETM and ITM trace.

Trace data from the ETM and ITM is sent to an external debugger through a 4-bit wide parallel trace port (TPIU), as illustrated in [Access port unlocking](#).

In addition to parallel trace mode, the TPIU supports serial trace mode through the serial wire output (SWO) trace protocol. Parallel and serial trace modes cannot be used at the same time. ETM trace is only supported in parallel trace mode. ITM trace is supported in both parallel and serial trace mode. See the debug documentation of the IDE for more information.

TPIU trace pins are multiplexed with GPIO pins. The **SWO** and **TRACEDATA[0]** pins can use the same GPIO. See [Pin assignments](#) on page 1219 for more information.

Trace speed is configured in the register **TRACEPORTSPEED**. Trace pin speed is determined by the GPIO drive setting of the multiplexed pins. See [GPIO — General purpose input/output](#) on page 292 for information on drive settings.

The trace speed must be configured according to the maximum speed of the GPIO pins used for trace. For information about GPIO speed, see [GPIO — General purpose input/output](#) on page 292.

9.6.1 Enabling the trace port

A specific sequence of operations must be performed to enable the trace port.

1. Enable trace and debug using the following code.

```
NRF_TAD_S->ENABLE = TAD_ENABLE_ENABLE_Msk;
```

2. Set drive strength to the highest possible value to ensure fast operation. Do this for all trace pins that will be used.

```
#define TRACE_PIN_CONFIG      ((GPIO_PIN_CNF_DRIVE0_E0 << GPIO_PIN_CNF_DRIVE0_Pos) \
                               | (GPIO_PIN_CNF_DRIVE1_E1 << GPIO_PIN_CNF_DRIVE1_Pos))
#define NRF_Px_S NRF_P2_S // From pin assignments

#define TRACE_PIN_CLEAR      (~ (GPIO_PIN_CNF_CTRLSEL_Msk | GPIO_PIN_CNF_DRIVE0_Msk \
                                  | GPIO_PIN_CNF_DRIVE1_Msk))

// Clear the bitfields before configuring to make sure the correct value is written.
NRF_Px_S->PIN_CNF[TRACE_TRACECLK_PIN] &= TRACE_PIN_CLEAR;
NRF_Px_S->PIN_CNF[TRACE_TRACEDATA0_PIN] &= TRACE_PIN_CLEAR;
NRF_Px_S->PIN_CNF[TRACE_TRACEDATA1_PIN] &= TRACE_PIN_CLEAR;
NRF_Px_S->PIN_CNF[TRACE_TRACEDATA2_PIN] &= TRACE_PIN_CLEAR;
NRF_Px_S->PIN_CNF[TRACE_TRACEDATA3_PIN] &= TRACE_PIN_CLEAR;

NRF_Px_S->PIN_CNF[TRACE_TRACECLK_PIN] |= TRACE_PIN_CONFIG;
NRF_Px_S->PIN_CNF[TRACE_TRACEDATA0_PIN] |= TRACE_PIN_CONFIG;
NRF_Px_S->PIN_CNF[TRACE_TRACEDATA1_PIN] |= TRACE_PIN_CONFIG;
NRF_Px_S->PIN_CNF[TRACE_TRACEDATA2_PIN] |= TRACE_PIN_CONFIG;
NRF_Px_S->PIN_CNF[TRACE_TRACEDATA3_PIN] |= TRACE_PIN_CONFIG;
```

3. Trace port speed is configured as a prescaled version of the CPU frequency and must be at least half the CPU frequency to avoid dropping trace packets. The trace speed must also be within the maximum speed of the GPIO pins used for trace. For information about GPIO speed, see [GPIO — General purpose input/output](#) on page 292.

```
NRF_TAD_S->TRACEPORTSPEED = TAD_TRACEPORTSPEED_TRACEPORTSPEED_DIV2;
```

4. Configure Arm CoreSight components. See documentation for Arm CoreSight for more information.

9.7 CTRL-AP — Control access port

The control access port (CTRL-AP) is a custom access port that enables control of the device when other access ports (AP) have been disabled by the access port protection.

For an overview of the other debug access ports, see [DAP](#).

Figure 180: Control access port details

Access port protection (APPROTECT) blocks the debugger from accessing the AHB-AP and prevents read and write access to all CPU registers and memory-mapped addresses. To enable access port protection for both secure and non-secure modes, use the registers UICR.SECUREAPPROTECT and UICR.APPROTECT.

Erase protection (ERASEPROTECT) protects the entire non-volatile memory, SICR, and UICR from being erased. Erase protection is enabled through UICR and disabled through cooperation between the firmware and debugger. For more information about disabling erase protection, see [Erase protection](#) on page 1185.

CTRL-AP has the following features:

- Reset the device
- Erase all
- Mailbox interface
- [INFO.PARTNO](#) and [INFO.HWREVISION](#) registers

The CTRL-AP peripheral has the following types of registers:

- Peripheral registers – Accessed by a CPU using the APB interface
- Debugger registers – Accessed by an external debugger using the CTRL-AP interface

9.7.1 Reset request

The debugger can request the device to perform a reset.

The register [RESET](#) is used to request the reset. Once the reset is performed, the reset reason is accessible through the RESETRAS register. For more information about reset, see [RESET — Reset control](#) on page 109.

9.7.2 Erase all

The erase all function lets the debugger trigger an erase of non-volatile memory, user information configuration registers (UICR), secure information configuration region (SICR), RAM, all peripheral settings, and also temporarily removes the access port protection.

To trigger an erase all function, follow the sequence in the following flowchart. After the sequence has completed, the access port protection is removed until the next pin reset, power-on reset, brownout reset, or watchdog timer reset.

Figure 181: Erase all states

Erase all protection

It is possible to prevent the debugger from performing an erase all operation by using either the TAMPC `TAMPC.PROTECT.ERASEPROTECT` register, or the `UICR.ERASEPROTECT` register followed by a device reset.

Once this has been configured, the CTRL-AP `ERASEALL` operation is disabled.

The register `ERASEPROTECT.STATUS` on page 1188 holds the status for erase protection.

9.7.2.1 Erase protection

Erase protection can be used to prevent a device from being erased.

A device ERASEALL operation can be initiated either by the non-volatile memory controller, or through the control access port. The following table describes the protection of the CTRL-AP ERASEALL operation. For more information, see [Access port protection](#) on page 1176

Access port protection state		ERASEALL operation
UICR.ERASEPROTECT	TAMPC.PROTECT.ERASEPROTECT	ERASEALL
Unprotected	Unprotected	Allowed
Protected	-	Disabled
-	Protected	Disabled

Table 77: Erase all protection

The debugger can read the erase protection status in the register [ERASEPROTECT.STATUS](#) on page 1188.

When erase protection is enabled, both the debugger and on-board firmware are required to disable it. The same non-zero 32-bit KEY value must be written to the debugger register [ERASEPROTECT.DISABLE](#) and CPU register [ERASEPROTECT.DISABLE](#) to disable erase protection. When both registers have been written with the same non-zero 32-bit KEY value, the device is automatically erased as described in [Erase all](#) on page 1183. The access ports will be re-enabled on the next reset once the secure erase sequence has completed.

Write to the write-once register [ERASEPROTECT.LOCK](#) on page 1194 as early as possible in the start-up sequence, preferably as soon as the on-chip firmware has determined it does not need to communicate with a debugger over the CTRL-AP mailbox interface. Once written, it will not be possible to remove the erase protection until the next pin reset, power-on reset, brownout reset, or watchdog timer reset, and therefore [ERASEPROTECT.DISABLE](#) is also disabled.

9.7.3 Mailbox interface

CTRL-AP implements a mailbox interface which enables the CPU to communicate with a debugger over the SWD interface.

The mailbox interface consists of a transmit register [MAILBOX.TXDATA](#) on page 1189 with its corresponding status register [MAILBOX.TXSTATUS](#) on page 1189, and a receive register [MAILBOX.RXDATA](#) on page 1189 with its corresponding status register [MAILBOX.RXSTATUS](#) on page 1189. Status bits in registers TXSTATUS/RXSTATUS will be set and cleared automatically when registers TXDATA/RXDATA are written to and read from, independently of the direction.

Figure 182: Mailbox register interface

Mailbox transfer sequence

1. Sender writes TXDATA
2. CTRL-AP sets sender's TXSTATUS to `DataPending`
3. CTRL-AP sets receiver's RXSTATUS to `DataPending`
4. Receiver reads RXDATA
5. CTRL-AP sets receiver's RXSTATUS to `NoDataPending`
6. CTRL-AP sets sender's TXSTATUS to `NoDataPending`

Events

`EVENTS_RXREADY` is generated when `MAILBOX.RXSTATUS` changes to `DataPending`. This indicates that a debugger has written new data to `MAILBOX.RXDATA`.

`EVENTS_TXDONE` is generated when the `MAILBOX.TXSTATUS` changes to `NoDataPending`. This indicates that a debugger has read the data from `MAILBOX.TXDATA`.

9.7.4 Device information

Device information, such as part number and hardware revision, can be read using CTRL-AP.

CTRL-AP provides the following information about the device:

- CTRL-AP identification register, IDR, see [IDR](#)
- Part number, see [INFO.PARTNO](#)
- Hardware revision, see [INFO.HWREVISION](#)

The information is available even for protected devices.

9.7.5 Debugger registers

CTRL-AP has a set of registers that can only be accessed from the debugger through the SWD interface. These are not accessible from the CPU.

9.7.5.1 Debug side registers

Register overview

Register	Offset	TZ	Description
RESET	0x000		System reset request and status
ERASEALL	0x004		Perform a secure erase of the device, where flash, SRAM, and UICR will be erased in sequence. The device will be returned to factory default settings upon next reset.
ERASEALLSTATUS	0x008		This is the status register for the ERASEALL operation.
ERASEPROTECT.STATUS	0x00C		Erase protection status.
ERASEPROTECT.DISABLE	0x010		This register disables ERASEPROTECT and performs Erase all.
APPROTECT.STATUS	0x014		This is the status register for the access port protection.
MAILBOX.TXDATA	0x020		Data sent from the debugger to the device.
MAILBOX.TXSTATUS	0x024		Status to indicate if data sent from the debugger to the device has been read.
MAILBOX.RXDATA	0x028		Data sent from the device to the debugger.
MAILBOX.RXSTATUS	0x02C		Status to indicate if data sent from the device to the debugger has been read.
INFO.PARTNO	0x030		Part number of the device
INFO.HWREVISION	0x034		Hardware Revision of the device
IDR	0x0FC		CTRL-AP Identification Register, IDR

9.7.5.1.1 RESET

Address offset: 0x000

System reset request and status

Only the enumerated values are supported, writing other values has unpredictable effect.

The Erase all operation cannot be interrupted by this reset request. Once the Erase all operation has started, CTRL-AP reset requests are ignored.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	W	RESET						Reset request																											
			NoReset	0				Release the RESET register value.																											
			SoftReset	1				Trigger soft reset of the device. Use NoReset after the device has been reset.																											
			HardReset	2				Trigger hard reset of the device. Use NoReset after the device has been reset.																											
								Use as part of the ERASEALL sequence.																											
			PinReset	4				Trigger pin reset of the device. Use NoReset after the device has been reset.																											

9.7.5.1.2 ERASEALL

Address offset: 0x004

Perform a secure erase of the device, where flash, SRAM, and UICR will be erased in sequence. The device will be returned to factory default settings upon next reset.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

9.7.6 Peripheral registers

CTRL-AP has a set of registers that can be accessed by the CPU.

9.7.6.1 CPU side registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
CTRLAP : S	GLOBAL	0x50052000	US	S	NSA	No	Control access port CPU side
CTRLAP : NS		0x40052000					

Register overview

Register	Offset	TZ	Description
EVENTS_RXREADY	0x100		RXSTATUS is changed to DataPending.
EVENTS_TXDONE	0x104		TXSTATUS is changed to NoDataPending.
INTEN	0x300		Enable or disable interrupt
INTENSET	0x304		Enable interrupt
INTENCLR	0x308		Disable interrupt
INTPEND	0x30C		Pending interrupts
MAILBOX.RXDATA	0x400		Data sent from the debugger to the CPU.
MAILBOX.RXSTATUS	0x404		Status to indicate if data sent from the debugger to the CPU has been read.
MAILBOX.TXDATA	0x480		Data sent from the CPU to the debugger.
MAILBOX.TXSTATUS	0x484		Status to indicate if data sent from the CPU to the debugger has been read.
ERASEPROTECT.LOCK	0x500		This register locks the ERASEPROTECT.DISABLE register from being written until next reset.
ERASEPROTECT.DISABLE	0x504		This register disables the ERASEPROTECT register and performs an ERASEALL operation.
RESET	0x520		System reset request.

9.7.6.1.1 EVENTS_RXREADY

Address offset: 0x100

RXSTATUS is changed to DataPending.

New data is available in MAILBOX.RXDATA.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	RW	EVENTS_RXREADY						RXSTATUS is changed to DataPending.																											
								New data is available in MAILBOX.RXDATA.																											
			NotGenerated	0				Event not generated																											
			Generated	1				Event generated																											

9.7.6.1.2 EVENTS_TXDONE

Address offset: 0x104

TXSTATUS is changed to NoDataPending.

MAILBOX.TXDATA has been read.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW	EVENTS_TXDONE			TXSTATUS is changed to NoDataPending.																														
					MAILBOX.TXDATA has been read.																														
			NotGenerated	0	Event not generated																														
			Generated	1	Event generated																														

9.7.6.1.3 INTEN

Address offset: 0x300

Enable or disable interrupt

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

			NoDataPending	0	No data is pending in register RXDATA.																														
			DataPending	1	Data is pending in register RXDATA.																														

9.7.6.1.9 MAILBOX.TXDATA

Address offset: 0x480

Data sent from the CPU to the debugger.

Writing to this register will automatically set field DataPending in register TXSTATUS.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0x00000000				0 0																															

9.7.6.1.10 MAILBOX.TXSTATUS

Address offset: 0x484

Status to indicate if data sent from the CPU to the debugger has been read.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
ID				A																																
Reset 0x00000000				0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ID	R/W	Field	Value ID	Value	Description																															
A	R	TXSTATUS			Status of data in register TXDATA.																															
			NoDataPending	0	No data is pending in register TXDATA.																															
			DataPending	1	Data is pending in register TXDATA.																															

9.7.6.1.11 ERASEPROTECT.LOCK

Address offset: 0x500

This register locks the ERASEPROTECT.DISABLE register from being written until next reset.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW1	LOCK			Writing any value will lock the ERASEPROTECT.DISABLE register from being written until next reset.																														
			Locked	1	Register ERASEPROTECT.DISABLE is read-only.																														

9.7.6.1.12 ERASEPROTECT.DISABLE

Address offset: 0x504

This register disables the ERASEPROTECT register and performs an ERASEALL operation.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID				A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A	A
Reset 0x00000000				0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ID	R/W	Field	Value ID	Value				Description																											
A	W1	KEY						The ERASEALL sequence is initiated if the value of the KEY fields are non-zero and the KEY fields match on both the CPU and debugger sides.																											

9.7.6.1.13 RESET

Address offset: 0x520

System reset request.

Only the enumerated values are supported, writing other values has unpredictable effect.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	W	RESET						Reset request																											
			NoReset	0				No reset is generated																											
			SoftReset	1				Perform a device soft reset																											
			HardReset	2				Perform a device hard reset																											
			PinReset	4				Perform a device pin reset																											

9.8 TAD — Trace and debug control

Configuration interface for trace and debug.

Please refer to the [Trace](#) section for more information about how to configure the trace and debug interface.

Note: When the trace port is enabled, all pins assigned to the trace port are acquired by the TAD peripheral and cannot be used for GPIO or other functions. This applies even when using the serial trace mode (SWO). See [Pin assignment chapter](#) for more information.

9.8.1 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description

9.9 ETM — Embedded trace macrocell

The ARM embedded trace macrocell implements instruction, data and event tracing.

This document only provides a register-level description of this ARM component. See the [Arm® Embedded Trace Macrocell Architecture Specification](#) for more details

9.9.1 Registers

Instances

Instance	Domain	Base address	TrustZone			Split access	Description
			Map	Att	DMA		
ETM	APPLICATION	0xE0041000	HF	NS	NA	No	Embedded trace macrocell

Register overview

Register	Offset	TZ	Description
TRCPRGCTLR	0x004		Enables the trace unit.
TRCPROCSCLR	0x008		Controls which PE to trace. Might ignore writes when the trace unit is enabled or not idle. Before writing to this register, ensure that TRCSTATR.IDLE == 1 so that the trace unit can synchronize with the chosen PE. Implemented if TRCIDR3.NUMPROC is greater than zero.
TRCSTATR	0x00C		Idle status bit
TRCCONFIGR	0x010		Controls the tracing options This register must always be programmed as part of trace unit initialization. Might ignore writes when the trace unit is enabled or not idle.
TRCEVENTCTLOR	0x20		Controls the tracing of arbitrary events. If the selected event occurs a trace element is generated in the trace stream according to the settings in TRCEVENTCTL1R.DATAEN and TRCEVENTCTL1R.INSTEN.
TRCEVENTCTL1R	0x24		Controls the behavior of the events that TRCEVENTCTLOR selects. This register must always be programmed as part of trace unit initialization. Might ignore writes when the trace unit is enabled or not idle.

Register	Offset	TZ	Description
TRCSTALLCTLR	0x2C		Enables trace unit functionality that prevents trace unit buffer overflows. Might ignore writes when the trace unit is enabled or not idle. Must be programmed if TRCIDR3.STALLCTL == 1.
TRCTSCTLR	0x30		Controls the insertion of global timestamps in the trace streams. When the selected event is triggered, the trace unit inserts a global timestamp into the trace streams. Might ignore writes when the trace unit is enabled or not idle. Must be programmed if TRCCONFIGR.TS == 1.
TRCSYNCPR	0x34		Controls how often trace synchronization requests occur. Might ignore writes when the trace unit is enabled or not idle. If writes are permitted then the register must be programmed.
TRCCCCTLR	0x38		Sets the threshold value for cycle counting. Might ignore writes when the trace unit is enabled or not idle. Must be programmed if TRCCONFIGR.CCI==1.
TRCBBCTLR	0x3C		Controls which regions in the memory map are enabled to use branch broadcasting. Might ignore writes when the trace unit is enabled or not idle. Must be programmed if TRCCONFIGR.BB == 1.
TRCTRACEIDR	0x40		Sets the trace ID for instruction trace. If data trace is enabled then it also sets the trace ID for data trace, to (trace ID for instruction trace) + 1. This register must always be programmed as part of trace unit initialization. Might ignore writes when the trace unit is enabled or not idle.
TRCQCTLR	0x44		Controls when Q elements are enabled. Might ignore writes when the trace unit is enabled or not idle. This register must be programmed if it is implemented and TRCCONFIGR.QE is set to any value other than 0b00.
TRCVICTLR	0x080		Controls instruction trace filtering. Might ignore writes when the trace unit is enabled or not idle. Only returns stable data when TRCSTATR.PMSTABLE == 1. Must be programmed, particularly to set the value of the SSSTATUS bit, which sets the state of the start/stop logic.
TRCVIICTLR	0x084		ViewInst exclude control. Might ignore writes when the trace unit is enabled or not idle. This register must be programmed when one or more address comparators are implemented.
TRCVISSCTLR	0x088		Use this to set, or read, the single address comparators that control the ViewInst start/stop logic. The start/stop logic is active for an instruction which causes a start and remains active up to and including an instruction which causes a stop, and then the start/stop logic becomes inactive. Might ignore writes when the trace unit is enabled or not idle. If implemented then this register must be programmed.
TRCVIPCSSCTLR	0x08C		Use this to set, or read, which PE comparator inputs can control the ViewInst start/stop logic. Might ignore writes when the trace unit is enabled or not idle. If implemented then this register must be programmed.

Register	Offset	TZ	Description
TRCVDCTLR	0x0A0		Controls data trace filtering. Might ignore writes when the trace unit is enabled or not idle. This register must be programmed when data tracing is enabled, that is, when either TRCCONFIGR.DA == 1 or TRCCONFIGR.DV == 1.
TRCVDSACCTLR	0x0A4		ViewData include / exclude control. Might ignore writes when the trace unit is enabled or not idle. This register must be programmed when one or more address comparators are implemented.
TRCVDARCCTLR	0x0A8		ViewData include / exclude control. Might ignore writes when the trace unit is enabled or not idle. This register must be programmed when one or more address comparators are implemented.
TRCSEQEVR[n]	0x100		Moves the sequencer state according to programmed events. Might ignore writes when the trace unit is enabled or not idle. When the sequencer is used, all sequencer state transitions must be programmed with a valid event.
TRCSEQRSTEV	0x118		Moves the sequencer to state 0 when a programmed event occurs. Might ignore writes when the trace unit is enabled or not idle. When the sequencer is used, all sequencer state transitions must be programmed with a valid event.
TRCSEQSTR	0x11C		Use this to set, or read, the sequencer state. Might ignore writes when the trace unit is enabled or not idle. Only returns stable data when TRCSTATR.PMSTABLE == 1. When the sequencer is used, all sequencer state transitions must be programmed with a valid event.
TRCEXTINSEL	0x120		Use this to set, or read, which external inputs are resources to the trace unit. Might ignore writes when the trace unit is enabled or not idle. Only returns stable data when TRCSTATR.PMSTABLE == 1. When the sequencer is used, all sequencer state transitions must be programmed with a valid event.
TRCCTRLDVR[n]	0x140		This sets or returns the reload count value for counter n. Might ignore writes when the trace unit is enabled or not idle.
TRCNTCTLR[n]	0x150		Controls the operation of counter n. Might ignore writes when the trace unit is enabled or not idle.
TRCNTVR[n]	0x160		This sets or returns the value of counter n. The count value is only stable when TRCSTATR.PMSTABLE == 1. If software uses counter n then it must write to this register to set the initial counter value. Might ignore writes when the trace unit is enabled or not idle.
TRCRSCTLR[n]	0x200		Controls the selection of the resources in the trace unit. Might ignore writes when the trace unit is enabled or not idle. If software selects a non-implemented resource then CONSTRAINED UNPREDICTABLE behavior of the resource selector occurs, so the resource selector might fire unexpectedly or might not fire. Reads of the TRCRSCTLRn might return UNKNOWN.
TRCSSCCR0	0x280		Controls the single-shot comparator.
TRCSSCSR0	0x2A0		Indicates the status of the single-shot comparators. TRCSSCSR0 is sensitive to instruction addresses.
TRCSSPICR0	0x2C0		Selects the processor comparator inputs for Single-shot control.
TRCPDCR	0x310		Controls the single-shot comparator.

Register	Offset	TZ	Description
TRCPDSR	0x314		Indicates the power down status of the ETM.
TRCITATBIDR	0xEE4		Sets the state of output pins.
TRCITIATBINR	0xEF4		Reads the state of the input pins.
TRCITIATBOUTr	0xEFC		Sets the state of the output pins.
TRCITCTRL	0xF00		Enables topology detection or integration testing, by putting ETM-M33 into integration mode.
TRCLAIMSET	0xFA0		Sets bits in the claim tag and determines the number of claim tag bits implemented.
TRCLAIMCLR	0xFA4		Clears bits in the claim tag and determines the current value of the claim tag.
TRCAUTHSTATUS	0xFB8		Indicates the current level of tracing permitted by the system
TRCDEVARCH	0xFBC		The TRCDEVARCH identifies ETM-M33 as an ETMv4.2 component
TRCDEVTYPE	0xFCC		Controls the single-shot comparator.
TRCPIDR[n]	0xFD0		Coresight peripheral identification registers.
TRCIDR[n]	0xFF0		Coresight component identification registers.

9.9.1.1 TRCPRGCTLR

Address offset: 0x004

Enables the trace unit.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value		Description																													
A	RW	EN				Trace unit enable bit																													
			Disabled	0		The trace unit is disabled. All trace resources are inactive and no trace is generated.																													
			Enabled	1		The trace unit is enabled.																													

9.9.1.2 TRCPROCSELR

Address offset: 0x008

Controls which PE to trace.

Might ignore writes when the trace unit is enabled or not idle.

Before writing to this register, ensure that TRCSTATR.IDLE == 1 so that the trace unit can synchronize with the chosen PE.

Implemented if TRCIDR3.NUMPROC is greater than zero.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

			Disabled	0	Data value tracing is disabled.																														
			Enabled	1	Data value tracing is enabled.																														

9.9.1.5 TRCEVENTCTL0R

Address offset: 0x20

Controls the tracing of arbitrary events.

If the selected event occurs a trace element is generated in the trace stream according to the settings in TRCEVENTCTL1R.DATAEN and TRCEVENTCTL1R.INSTEN.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A A A A A A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	RW	EVENT		[0:255]				Select which event should generate trace elements.																											

9.9.1.6 TRCEVENTCTL1R

Address offset: 0x24

Controls the behavior of the events that TRCEVENTCTL0R selects.

This register must always be programmed as part of trace unit initialization.

Might ignore writes when the trace unit is enabled or not idle.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																																													
ID																																G F														E D C B A			
Reset 0x00000000				0 0																																													
ID	R/W	Field	Value ID	Value	Description																																												
A-D	RW	INSTEN[i] (i=0..3)			Instruction event enable field.																																												
			Disabled	0	The trace unit does not generate an Event element.																																												
			Enabled	1	The trace unit generates an Event element for event i, in the instruction trace stream.																																												
E	RW	DATAEN			Data event enable bit.																																												
			Disabled	0	The trace unit does not generate an Event element if event 0 occurs.																																												
			Enabled	1	The trace unit generates an Event element in the data trace stream if event 0 occurs.																																												
F	RW	ATB			AMBA Trace Bus (ATB) trigger enable bit.																																												
			Disabled	0	ATB trigger is disabled.																																												
			Enabled	1	ATB trigger is enabled. If a CoreSight ATB interface is implemented then when event 0 occurs the trace unit generates an ATB event.																																												
G	RW	LPOVERRIDE			Low-power state behavior override bit. Controls how a trace unit behaves in low-power state.																																												
			Disabled	0	Trace unit low-power state behavior is not affected. That is, the trace unit is enabled to enter low-power state.																																												
			Enabled	1	Trace unit low-power state behavior is overridden. That is, entry to a low-power state does not affect the trace unit resources or trace generation.																																												

9.9.1.7 TRCSTALLCTL

Address offset: 0x2C

Enables trace unit functionality that prevents trace unit buffer overflows.

Might ignore writes when the trace unit is enabled or not idle.

Must be programmed if TRCIDR3.STALLCTL == 1.

Bit number			31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID																			G F E D C B				A A A A											
Reset 0x00000000			0 0																															
ID	R/W	Field	Value ID	Value	Description																													
A	RW	LEVEL		[15:0]	Threshold level field.																													
					If LEVEL is nonzero then a trace unit might suppress the generation of:																													
					Global timestamps in the instruction trace stream and the data trace stream.																													
					Cycle counting in the instruction trace stream, although the cumulative cycle count remains correct.																													
			Min	0	Zero invasion. This setting has a greater risk of a FIFO overflow																													
		Max	15	Maximum invasion occurs but there is less risk of a FIFO overflow.																														
B	RW	ISTALL			Instruction stall bit. Controls if a trace unit can stall the PE when the instruction trace buffer space is less than LEVEL.																													
			Disabled	0	The trace unit must not stall the PE.																													
			Enabled	1	The trace unit can stall the PE.																													
C	RW	DSTALL			Data stall bit. Controls if a trace unit can stall the PE when the data trace buffer space is less than LEVEL.																													
			Disabled	0	The trace unit must not stall the PE.																													
			Enabled	1	The trace unit can stall the PE.																													

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID																												G F E D C B				A A A A			
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
D	RW	INSTPRIORITY			Prioritize instruction trace bit. Controls if a trace unit can prioritize instruction trace when the instruction trace buffer space is less than LEVEL.																														
			Disabled	0	The trace unit must not prioritize instruction trace.																														
			Enabled	1	The trace unit can prioritize instruction trace. A trace unit might prioritize instruction trace by preventing output of data trace, or other means which ensure that the instruction trace has a higher priority than the data trace.																														
E	RW	DATADISCARDLOAD			Data discard field. Controls if a trace unit can discard data trace elements on a load when the data trace buffer space is less than LEVEL.																														
			Disabled	0	The trace unit must not discard any data trace elements.																														
			Enabled	1	The trace unit can discard P1 and P2 elements associated with data loads.																														
F	RW	DATADISCARDSTORE			Data discard field. Controls if a trace unit can discard data trace elements on a store when the data trace buffer space is less than LEVEL.																														
			Disabled	0	The trace unit must not discard any data trace elements.																														
			Enabled	1	The trace unit can discard P1 and P2 elements associated with data stores.																														
G	RW	NOOVERFLOW			Trace overflow prevention bit.																														
			Disabled	0	Trace overflow prevention is disabled.																														
			Enabled	1	Trace overflow prevention is enabled. This might cause a significant performance impact.																														

9.9.1.8 TRCTSCTLR

Address offset: 0x30

Controls the insertion of global timestamps in the trace streams.

When the selected event is triggered, the trace unit inserts a global timestamp into the trace streams.

Might ignore writes when the trace unit is enabled or not idle.

Must be programmed if TRCONFIGR.TS == 1.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value		Description																													
A-H	RW	RANGE[i] (i=0..7)				Address range field. Selects which address range comparator pairs are in use with branch broadcasting. Each field represents an address range comparator pair, so field[i] controls the selection of address range comparator pair i.																													
			Disabled	0		The address range that address range comparator pair i defines, is not selected.																													
			Enabled	1		The address range that address range comparator pair n defines, is selected.																													

9.9.1.12 TRCTRACEIDR

Address offset: 0x40

Sets the trace ID for instruction trace. If data trace is enabled then it also sets the trace ID for data trace, to (trace ID for instruction trace) + 1.

This register must always be programmed as part of trace unit initialization.

Might ignore writes when the trace unit is enabled or not idle.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															

9.9.1.13 TRCQCTLR

Address offset: 0x44

Controls when Q elements are enabled.

Might ignore writes when the trace unit is enabled or not idle.

This register must be programmed if it is implemented and TRCCONFIGR.QE is set to any value other than 0b00.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				I H G F E D C B A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
A-H	RW	RANGE[i] (i=0..7)			Specifies the address range comparators to be used for controlling Q elements.																														
			Disabled	0	Address range comparator i is disabled.																														
			Enabled	1	Address range comparator i is selected for use.																														
I	RW	MODE			Selects whether the address range comparators selected by the RANGE field indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:																														
			Exclude	0	Exclude mode. The address range comparators selected by the RANGE field indicate address ranges where the trace unit cannot generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.																														
			Include	1	Include mode. The address range comparators selected by the RANGE field indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled.																														

9.9.1.14 TRCVICTLR

Address offset: 0x080

Controls instruction trace filtering.

Might ignore writes when the trace unit is enabled or not idle.

Only returns stable data when TRCSTATR.PMSTABLE == 1.

Must be programmed, particularly to set the value of the SSSTATUS bit, which sets the state of the start/stop logic.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ID	R/W	Field	Value ID	Value	Description																														
A-H	RW	F[i] (i=0..7)			Forward field.																														
			Disabled	0	The trace event does not affect the sequencer.																														
			Enabled	1	When the event occurs then the sequencer state moves from state n to state n+1.																														
I-P	RW	B[i] (i=0..7)			Backward field.																														
			Disabled	0	The trace event does not affect the sequencer.																														
			Enabled	1	When the event occurs then the sequencer state moves from state n+1 to state n.																														

9.9.1.22 TRCSEQRSTVR

Address offset: 0x118

Moves the sequencer to state 0 when a programmed event occurs.

Might ignore writes when the trace unit is enabled or not idle.

When the sequencer is used, all sequencer state transitions must be programmed with a valid event.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	RW	EVENT		[0:255]				Select which event should reset the sequencer.																											

9.9.1.23 TRCSEQSTR

Address offset: 0x11C

Use this to set, or read, the sequencer state.

Might ignore writes when the trace unit is enabled or not idle.

Only returns stable data when TRCSTATR.PMSTABLE == 1.

When the sequencer is used, all sequencer state transitions must be programmed with a valid event.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

A	RW	STATE				Sets or returns the state of the sequencer.																																
			State0	0	The sequencer is in state 0.																																	
			State1	1	The sequencer is in state 1.																																	
			State2	2	The sequencer is in state 2.																																	
			State3	3	The sequencer is in state 3.																																	

9.9.1.24 TRCEXTINSEL

Address offset: 0x120

Use this to set, or read, which external inputs are resources to the trace unit.

Might ignore writes when the trace unit is enabled or not idle.

Only returns stable data when TRCSTATR.PMSTABLE == 1.

When the sequencer is used, all sequencer state transitions must be programmed with a valid event.

Bit number				31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID	R/W	Field	Value ID	Value				Description																											
A-D	RW	SEL[i] (i=0..3)		[0:255]				Each field in this collection selects an external input as a resource for the trace unit.																											

9.9.1.25 TRCCNTRLDVR[n] (n=0..3)

Address offset: 0x140 + (n × 0x4)

This sets or returns the reload count value for counter n.

Might ignore writes when the trace unit is enabled or not idle.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value				Description																											
A	RW	VALUE		[0:65535]				Contains the reload value for counter n. When a reload event occurs for counter n then the trace unit copies the VALUEn field into counter n.																											

9.9.1.26 TRCCNTCTLR[n] (n=0..3)

Address offset: 0x150 + (n × 0x4)

Controls the operation of counter n.

Might ignore writes when the trace unit is enabled or not idle.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0																															
ID				D C B B B B B B B A A A A A A A A																															
Reset 0x00000000				0 0																															
ID	R/W	Field	Value ID	Value	Description																														
A	RW	CNTEVENT		[0:255]	Selects an event, that when it occurs causes counter n to decrement.																														
B	RW	RLDEVENT		[0:255]	Selects an event, that when it occurs causes a reload event for counter n.																														
C	RW	RLDSELF			Controls whether a reload event occurs for counter n, when counter n reaches zero.																														
			Disabled	0	The counter is in Normal mode.																														
			Enabled	1	The counter is in Self-reload mode.																														
D	RW	CNTCHAIN			For TRCCNTCTLR3 and TRCCNTCTLR1, this bit controls whether counter n decrements when a reload event occurs for counter n-1.																														
			Disabled	0	Counter n does not decrement when a reload event for counter n-1 occurs.																														
			Enabled	1	Counter n decrements when a reload event for counter n-1 occurs. This concatenates counter n and counter n-1, to provide a larger count value.																														

9.9.1.27 TRCCNTVR[n] (n=0..3)

Address offset: 0x160 + (n × 0x4)

This sets or returns the value of counter n.

The count value is only stable when TRCSTATR.PMSTABLE == 1.

If software uses counter n then it must write to this register to set the initial counter value.

Might ignore writes when the trace unit is enabled or not idle.

Bit number				31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

9.10 TPIU — Trace port interface unit

The Arm Cortex-M33 TPIU bridges the on-chip trace data from the ETM and the ITM, with separate IDs, to a data stream.

The Arm Cortex-M33 TPIU encapsulates IDs where required, and an external Trace Port Analyzer (TPA) captures the data stream. See the [Arm Cortex-M33 Processor Technical Reference Manual](#) for more details.

9.10.1 Registers

10 Hardware and layout

10.1 Pin assignments

The pin assignment figures and tables describe the pinouts for the product variants of the device.

The nRF54LM20A and nRF54LM20B device provides flexibility regarding GPIO pin routing and configuration. Some pins have limitations or recommendations on how the pin should be configured or what it should be used for.

As a general rule, peripherals must use GPIO pins in their own domain, and can be used for all peripheral functions when selected in the peripheral's PSEL register. Serial peripherals must use pins from the same port. Note the dedicated clock pin requirements. The dedicated clock pin requirements are described in [Clock pins](#) on page 1219. Some device functions must use specific pins, as listed in [Pin assignments](#) on page 1219.

The block diagram shows which peripheral and port belong together, see [Block diagram](#) on page 9.

The different GPIO ports have different properties. For details, see [GPIO — General purpose input/output](#) on page 292.

10.1.1 Dedicated pins

The device has some pins dedicated for specific purposes. GPIO pin routing and configuration is flexible. Some pins have limitations or recommendations for configuration and use.

Peripheral	Description
TRACE	Has dedicated pins that must be configured using extra high drive E0/E1 configuration in the DRIVE0/1 fields of the PIN_CNF GPIO register.
GRTC	Has dedicated pins for clock and PWM output.
TAMPC	Has dedicated pins for active shield input and output.
FLPR	Uses dedicated pins on P2 for emulated peripherals such as QSPI.
RADIO	Uses dedicated pins on P1 for antenna switch control (DFEGPIO for direction finding).
NFC	Uses dedicated pins as listed in the pin assignments table for the selected device. These pins are configured as NFC antenna pins from reset. To use the pins for Digital I/O, NFC function must be disabled in the NFCT — Near field communication tag on page 352 peripheral.

Table 78: Dedicated pin functions

10.1.2 Clock pins

The device has dedicated clock pins.

Some peripherals have clock signals. Dedicated clock pins have been optimized to ensure correct timing relationship between clock and data signals for these peripherals. See the following table for which peripheral signals must use clock pins. The pin assignment table identifies clock pins.

Clock pins can also be used as regular I/O data pins.

The peripheral data signal must be configured to use pins close to the clock pin. This ensures that the internal paths from the peripheral to the pin have the same delay, so that the data and clock signals reach the pins at the same time.

For high-speed signals, the printed circuit board (PCB) layout must use short PCB traces of identical length. This makes sure any delays are kept to a minimum, with close to identical delay on the clock and data path.

The following table shows which peripheral signals must use clock pins.

Peripheral	Signal	Clock pin required
SPIM/SPIS	SDO	
	SDI	
	SCK	Yes
	CSN	
	DCX	
TWIM/TWIS	SCL	Yes
PDM	DIN	
	CLK	Yes
TDM	MCK	Yes
	FSYNC	
	SCK	Yes
	SDIN	
	SDOUT	
TRACE	TRACEDATA[]	
	TRACECLK	Yes (dedicated pin)
GRTC	CLKOUT32K	Yes (dedicated pin)
	PWMOUT	Yes (dedicated pin)
	CLKOUTFAST	Yes (dedicated pin)

Table 79: List of peripheral signals and clock pin requirement

10.1.3 CSP61 (CAAA) package pin assignments

The CSP61 pin assignment figure and table describe the pinouts for this variant of the device.

Pins that can be used as clock signals are shown in as red in the figure. For more information about clock pins, see [Clock pins](#) on page 1219.

Figure 183: CSP61 pin assignments, top view

Pin	Clock pin	Name	Function	Description	Dedicated function

Table 80: CSP61 pin assignments

10.1.4 CSP98 (PAAA) package pin assignments

The CSP98 pin assignment figure and table describe the pinouts for this variant of the device.

Pins that can be used as clock signals are shown in as red in the figure. For more information about clock pins, see [Clock pins](#) on page 1219.

Figure 184: CSP98 pin assignments, top view

Table 86: Package dimensions in millimeters

10.3 Reference circuitry

To ensure good RF performance when designing PCBs, it is highly recommended to use the PCB layouts and component values provided by Nordic Semiconductor.

Documentation for the different package reference circuits, including Altium Designer files, PCB layout files, and PCB production files can be downloaded from www.nordicsemi.com.

In this section, there are reference circuits for all product variants, showing the components and component values to support on-chip features in a design.

10.3.1 Circuit configuration 1 for CSP98 (PAAA)

Config no.	Supply configuration	Enabled features	
		USB	NFC
Config. 1	DCDC: supplied by battery or external supply	Yes	No

Table 87: Configuration summary for circuit configuration no. 1

Figure 189: Circuit configuration no. 1 schematic

The reference schematic shows the USB supply path, including the on-chip USB regulator and the decoupling and tuning components required at the USB pins (VBUS, DECUSB, D+, D-, and TXRTUNE). ESD and overvoltage protection components on the USB interface are not shown in this schematic. For a USB connector that may be exposed to ESD or overvoltage, the design must add appropriate protection on the VBUS and data lines in addition to the components shown here.

Note: For PCB reference layouts, see the product page for the nRF54LM20A and nRF54LM20B on www.nordicsemi.com.

Designator	Value	Description	Footprint
C1, C2, C5	100 nF	Capacitor, X7R, $\pm 10\%$	0201
C3	1.2 pF	Capacitor, NP0, 50 V, $\pm 0.05\text{pF}$	0201
C4	10 μF	Capacitor, X6S, 6.3 V, $\pm 20\%$	0402
C6	4.7 μF	Capacitor, X5R, 6.3 V, $\pm 20\%$	0201
C7, C13	NC	Not mounted	0201
C8	1.0 pF	Capacitor, C0G/NP0, 25 V	0201
C10, C14	2.2 μF	Capacitor, X6T, 2.5 V, $\pm 20\%$	0201
C11	4.7 μF	Capacitor, X5R, 10 V	0402
C12	1.5 pF	Capacitor, NP0, $\pm 0.05\text{ pF}$, 25V, High Q	0201
FB1	120 Ω	Ferrite bead, 120 Ω at 100 MHz, 200 mA, 500 m Ω max	0201
L1	4.7 μH	Inductor, 120 mA, $\pm 20\%$, 0.65 Ω	0603
L2	3.6 nH	Inductor, 500 mA, $\pm 0.1\text{ nH}$, 170 m Ω	0201
L3	4.7 nH	Inductor, 300 mA, $\pm 3\%$, 250 m Ω	0201
L4	3.3 nH	Inductor, 500 mA, $\pm 0.1\text{ nH}$, 170 m Ω	0201
L5	1.0 nH	Inductor, 750 mA, $\pm 0.2\text{ nH}$	0201
R1	2.2 Ω	Resistor, $\pm 1\%$, 0.05 W	0201
R2	200 Ω	Resistor, $\pm 1\%$, 0.05 W	0201
U1	nRF54LM20A-PAAA	Multiprotocol Bluetooth Low Energy, IEEE 802.15.4, and 2.4GHz proprietary System on Chip	CSP98
X1	32 MHz	Crystal SMD 2016, 32 MHz, CI = 8 pF, Total Tol: $\pm 40\text{ ppm}$. For frequency tolerance requirements, see 32 MHz crystal oscillator (HFXO) on page 1261.	XTAL_2016
X2	32.768 kHz	Crystal SMD 2012, 32.768 kHz, CI = 9 pF, Total tol: $\pm 20\text{ ppm}$	XTAL_2012

Table 88: Bill of material for circuit configuration no. 1

10.3.2 PCB layout example

The PCB layout in the following figure is a reference layout for Circuit configuration 1 for CSP98 (PAAA).

For all available reference layouts, see the product pages for nRF54LM20A and nRF54LM20B on www.nordicsemi.com.

10.3.3 PMIC support

The nRF54L Series is comprehensively supported by Nordic Semiconductor's own range of PMICs (Power Management Integrated Circuits). These PMICs are meticulously designed to enhance the performance and efficiency of the nRF54L Series devices. This integration ensures the longest battery life and the highest reliability for the end application. The synergy between the nRF54L Series and the Nordic PMICs highlights Nordic Semiconductor's commitment to providing a complete and cohesive solution for their customers' needs in wireless technology applications.

10.4 Package thermal characteristics

A summary of the thermal characteristics for the different packages available for the device can be found below.

Symbol	Package	Typ.	Unit
$\theta_{JA,CSP}$	CSP98	34.94	°C/W
$\theta_{JC,CSP}$	CSP98	8.16	°C/W

Table 89: Package thermal characteristics

Values for θ_{JA} are obtained by simulation following the EIA/JESD51-2 for still air condition using JEDEC PCB.

Values for θ_{JC} are obtained by simulation. A cold plate and the grease between package and cold plate are modeled.

11 Electrical specifications

11.1 Conditions

The following table shows a set of common conditions used in all scenarios, unless otherwise stated.

Condition	Value	Note
Supply	3 V on VDD	
Temperature	25°C	
CPU	WFI (wait for interrupt)/WFE (wait for event) sleep	
Peripherals	All IDLE	
Clock	HFCLK = HFINT running at 128 MHz LFCLK = Not running	
Regulator	DC/DC	
GPIO	Port 2 HSBIAS =3 (fastest slew rate)	Applies for timing specifications for GPIO port P2 using Extra high drive strength
RAM	32 kB	In System ON, RAM value refers to the amount of RAM that is powered. The remaining RAM is powered off and not retained. In System OFF, RAM value refers to amount of RAM that is retained.
External components	As reference circuitry	See Reference circuitry on page 1246 for details.
Cache enabled	Yes	Only applies when the CPU is running from non-volatile memory.
Compiler version	GCC version 10.3.1 20210621	
Compiler flags	<code>-O0 -fno-strict-aliasing -fno-delete-null-pointer-checks -fomit-frame-pointer -ffunction-sections -fmax-errors=1 -mcpu=cortex-m33 -mthumb -falign-functions=16 -mfloat-abi=soft -msoft-float</code>	

Table 90: Current consumption scenarios, common conditions

11.2 Current consumption

Because the power and clock management system is constantly adjusting power and clock sources, it is difficult to estimate an application's current consumption. To facilitate the estimation process, a set of current consumption scenarios is provided to show the typical current drawn from the supply pins.

Each scenario specifies a set of operations and conditions applying to the given scenario. All scenarios are listed in the following sections.

11.2.1 CURRENT Electrical specification

11.2.1.1 Sleep

Symbol	Description	Min.	Typ.	Max.	Units
I_{OFF0}	System OFF, Wake on pin, 0 KB RAM retained		0.7		μA
I_{OFF1}	System OFF, Wake on pin + GRTC, LFXO, 0 KB RAM retained		1.0		μA
$I_{ONIDLE0}$	System ON, Wake on pin, 32 KB RAM retained		1.1		μA
$I_{ONIDLE1}$	System ON, Wake on pin, 512 KB RAM retained		4.0		μA
$I_{ONIDLE2}$	System ON, Wake on pin + GRTC, LFXO, 512 KB RAM retained		4.3		μA

Figure 199: System OFF, Wake on pin, 0 KB RAM retained (typical values)

Figure 200: System ON, Wake on pin + GRTC, LFXO, 512 KB RAM retained (typical values)

11.2.1.2 Axon NPU running

The following table summarizes the typical performance of Axon NPU.

Symbol	Description	Min.	Typ.	Max.	Units
I _{AXONS0}	DS-CNN keyword spotting (KWS)		3.0		mA
I _{AXONS1}	Autoencoder (dense, AD)		3.5		mA
I _{AXONS2}	MobileNetV1 (VWW)		2.8		mA
I _{AXONS3}	ResNet (IC)		2.7		mA

11.2.1.3 COMP active

Symbol	Description	Min.	Typ.	Max.	Units
I _{COMP0}	COMP enabled in Low-power mode		42		µA
I _{COMP1}	COMP enabled in Normal mode		44		µA
I _{COMP2}	COMP enabled in High-speed mode		48		µA

11.2.1.4 CPU running

The CPU running parameters are obtained using the following compiler version:

Compiler: Arm version 6.16 (armclang)

Compiler flags:

```
--target=arm-arm-none-eabi -c -g -masm=auto -Wno-unused-value -mcpu=cortex-m33 -mfloat-abi=hard -mfpu=fpv5-sp-d16 -flto -Omax
```

Linker flags:

```
--lto --remove
```

Symbol	Description	Min.	Typ.	Max.	Units
I _{APPCPU0}	CPU running Coremark at 128 MHz from NVM, Cache enabled		2.4		mA

Figure 201: CPU running Coremark at 128 MHz from NVM, Cache enabled (typical values)

11.2.1.5 QDEC active

Symbol	Description	Min.	Typ.	Max.	Units
I _{QDEC0}	QDEC enabled but not running		94		μA
I _{QDEC1}	QDEC running, 131 ms sample period		135		μA

11.2.1.6 RADIO transmitting/receiving

Symbol	Description	Min.	Typ.	Max.	Units
I _{RADIO_RX0}	Radio RX, 1 Mbps, HFXO		3.3		mA
I _{RADIO_TX0}	Radio TX, 0 dBm, HFXO		5.0		mA
I _{RADIO_TX1}	Radio TX, 4 dBm, HFXO		7.1		mA
I _{RADIO_TX2}	Radio TX, 8 dBm, HFXO		10.9		mA

Figure 202: Radio RX, 1 Mbps, HFXO (typical values)

Figure 203: Radio TX, 8 dBm, HFXO (typical values)

11.2.1.7 RNG active

Symbol	Description	Min.	Typ.	Max.	Units
I_{RNG0}	CRCEN running RNG, 512 KB RAM retained		1.9		mA

11.2.1.8 SAADC active

Symbol	Description	Min.	Typ.	Max.	Units
I _{SAADC0}	SAADC, 2 Msps, HFXO, 512 KB RAM retained		1.3		mA

11.2.1.9 TEMP active

Symbol	Description	Min.	Typ.	Max.	Units
I _{TEMP0}	TEMP continuously sampling via DPPI connections		0.31		mA

11.2.1.10 TIMER active

Symbol	Description	Min.	Typ.	Max.	Units
I _{TIMER0}	TIMER00 running at 128 MHz		480		μA
I _{TIMER1}	TIMER20 running at 16 MHz		171		μA
I _{TIMER2}	TIMER20 running at 1 MHz		139		μA
I _{TIMER3}	TIMER10 running at 32MHz, HFXO		198		μA

11.2.1.11 WDT active

Symbol	Description	Min.	Typ.	Max.	Units
I _{WDT0}	WDT active		3.6		μA
I _{WDT1}	WDT active, LFXO		3.2		μA

11.2.1.12 RRAM active

Symbol	Description	Min.	Typ.	Max.	Units
I _{RRAM0}	System ON, CPU running @ 128 MHz, writing in unbuffered mode 32-bit words to RRAM, 512 KB RAM retained		3.5		mA

11.3 AXONS Electrical specification

11.3.1 Timing specifications

Symbol	Description	Min.	Typ.	Max.	Units
t _{KWS}	Time to run DS-CNN keyword spotting (KWS) model		4.5		ms
t _{AD}	Time to run Autoencoder (dense, AD) model		1.3		ms
t _{VWV}	Time to run MobileNetV1 (VWV) model		14.4		ms
t _{IC}	Time to run ResNet (IC) model		17.9		ms

11.4 CLOCK Electrical specification

11.4.1 High frequency clock source (HFCLK)

Symbol	Description	Min.	Typ.	Max.	Units
f_{NOM}	Nominal output frequency		64/128		MHz
$f_{\text{TOL_HFINT}}$	Frequency tolerance when running from internal oscillator	-10		6	%
$t_{\text{START_HFINT}}$	Startup time for internal RC oscillator			6	μs

11.4.2 32.768 kHz clock source (LFCLK)

Symbol	Description	Min.	Typ.	Max.	Units
$f_{\text{NOM_LFCLK}}$	Nominal output frequency		32.768		kHz
$t_{\text{START_LFXO}}$	Startup time for 32.768 kHz crystal oscillator		0.43		s
$f_{\text{TOL_LFRC}}$	Frequency tolerance, uncalibrated			± 4.5	%
$f_{\text{TOL_CAL_LFRC}}$	Frequency tolerance after calibration. Constant temperature within $\pm 0.5^\circ\text{C}$, calibration performed at least every 8 seconds, averaging interval $> 7.5\text{ ms}$, defined as 3 sigma.			± 250	ppm
$t_{\text{START_LFRC}}$	Startup time for internal RC oscillator		1000		μs

11.5 COMP Electrical specification

11.5.1 COMP Electrical Specification

Symbol	Description	Min.	Typ.	Max.	Units
$t_{\text{PROPDLV,LP}}$	Propagation delay, low-power mode ³		0.5		μs
$t_{\text{PROPDLV,HS}}$	Propagation delay, high-speed mode ³		0.1		μs
I_{SOURCE}	Configurable input current provided by the output driven current source.				μA
$I_{\text{SOURCE,A}}$	Current when register ISOURCE=len2uA5	1.4	2.2	3.6	μA
$I_{\text{SOURCE,B}}$	Current when register ISOURCE=len5uA	3.3	4.5	6.1	μA
$I_{\text{SOURCE,C}}$	Current when register ISOURCE=len10uA	6.7	8.9	11.3	μA
V_{DIFFHYST}	Optional hysteresis applied to differential input	40	60	80	mV
$t_{\text{INT_REF,START}}$	Startup time for the internal bandgap reference		1.5	2.2	μs
$E_{\text{INT_REF}}$	Internal bandgap reference error	-4.7	0	4.0	%
$V_{\text{INPUTOFFSET}}$	Input offset	-15	0	15	mV
$t_{\text{COMP,START}}$	Startup time for the comparator core		3		μs

11.6 CPU Electrical specification

11.6.1 CPU performance

The CPU performance metrics are derived from benchmarks executed on highly optimized firmware. The firmware is compiled using the specified compiler version and settings to ensure accurate and reliable performance data.

Compiler: Arm version 6.16 (armclang)

Compiler flags:

```
--target=arm-arm-none-eabi -c -g -masm=auto -Wno-unused-value -mcpu=cortex-m33 -mfloat-abi=hard -mfpu=fpv5-sp-d16 -flto -Omax
```

³ Propagation delay is with 10 mV overdrive.

Linker flags:

```
--lto --remove
```

Symbol	Description	Min.	Typ.	Max.	Units
CM _{RRAM} CACHE128	CPU running CoreMark at 128 MHz from RRAM, cache enabled		503		CoreMark
CM _{IRam} 128/MHz	CoreMark per MHz, running from RRAM, cache enabled, HFXO128M		3.93		CoreMark/ MHz
CM _{RAM} 128	CPU running CoreMark at 128 MHz from RAM		464		CoreMark

11.6.2 CPU wakeup times

Symbol	Description	Min.	Typ.	Max.	Units
t _{R2ON}	Time from pin reset to CPU executes the first instruction		44		μs
t _{OFF2ON}	Time from wake-up from System OFF mode to CPU executes the first instruction		37		μs
t _{IDLE2CPU,POWEROFF}	Wakeup time from CPU sleep (WFI,WFE) to CPU executes the next instruction, RRAMC LOWPOWERCONFIG is using PowerOff mode. CACHE is disabled.		18		μs
t _{IDLE2CPU,CONSTLAT,POWEROFF}	Wakeup time from CPU sleep (WFI,WFE) to CPU executes the next instruction in constant latency sub-mode, RRAMC LOWPOWERCONFIG is using PowerOff mode. CACHE is disabled.		17		μs
t _{IDLE2CPU,CACHE}	Wakeup time from CPU sleep (WFI,WFE) to CPU executes the next instruction. CACHE is enabled.		2		μs
t _{IDLE2CPU,STANDBY}	Wakeup time from CPU sleep (WFI,WFE) to CPU executes the next instruction, RRAMC LOWPOWERCONFIG is using Standby mode. CACHE is disabled.		0.5		μs
t _{IDLE2CPU,CACHE,CONSTLAT}	Wakeup time from CPU sleep (WFI,WFE) to CPU executes the next instruction in constant latency sub-mode, CACHE enabled.		0.3		μs

11.7 GPIO Electrical specification

11.7.1 GPIO Electrical Specification

Symbol	Description	Min.	Typ.	Max.	Units
V _{IH}	Input high voltage	0.7 × VDD		VDD	V
V _{IL}	Input low voltage	VSS		0.3 × VDD	V
V _{OH,SD}	Output high voltage, standard drive, 0.5 mA, VDD ≥ 1.7	VDD - 0.4		VDD	V
V _{OH,HDL}	Output high voltage, high drive, 5 mA, VDD ≥ 2.7 V	VDD - 0.4		VDD	V
V _{OH,HDL}	Output high voltage, high drive, 3 mA, VDD ≥ 1.7 V	VDD - 0.4		VDD	V
V _{OL,SD}	Output low voltage, standard drive, 0.5 mA, VDD ≥ 1.7	VSS		VSS + 0.4	V
I _{OL,SD}	Current at VSS+0.4 V, output set low, standard drive, VDD ≥ 1.7	1	3	4	mA
I _{OL,HDL}	Current at VSS+0.4 V, output set low, high drive, VDD ≥ 1.7 V	3			mA
I _{OL,ED}	Current at VSS+0.4 V, output set low, extra drive, VDD ≥ 1.7 V	16			mA
I _{OH,SD}	Current at VDD-0.4 V, output set high, standard drive, VDD ≥ 1.7	1	3	4	mA
I _{OH,HDL}	Current at VDD-0.4 V, output set high, high drive, VDD ≥ 1.7 V	4			mA
I _{OH,ED}	Current at VDD-0.4 V, output set high, extra drive, VDD ≥ 1.7 V	14			mA
I _{GPIO,TOTAL}	Recommended maximum sustained current drawn by all GPIOs			15	mA
t _{RF,15pF}	Rise/fall time, standard drive mode, 10-90%, 15 pF load ¹		8		ns

¹ Rise and fall times based on simulations

Symbol	Description	Min.	Typ.	Max.	Units
$t_{RF,25pF}$	Rise/fall time, standard drive mode, 10-90%, 25 pF load ¹		12		ns
$t_{RF,50pF}$	Rise/fall time, standard drive mode, 10-90%, 50 pF load ¹		21		ns
$t_{HRF,12pF}$	Rise/Fall time, high drive mode, 20-80%, 12 pF load ¹		4		ns
$t_{ERF,12pF}$	Rise/Fall time, extra drive mode, 20-80%, 12 pF load ¹		0.9		ns
R_{PU}	Pull-up resistance	12	14	16	k Ω
R_{PD}	Pull-down resistance	12	14	18	k Ω
$t_{OE,ED}$	Output enable delay in extra drive mode			855	ns
C_{PAD}	Pad capacitance		1		pF
C_{PAD_NFC}	Pad capacitance on NFC pads		5		pF

11.8 LPCOMP Electrical specification

11.8.1 LPCOMP Electrical Specification

Symbol	Description	Min.	Typ.	Max.	Units
$t_{LPCANDET}$	Time from VIN crossing (≥ 50 mV above threshold) to ANADETECT signal generated		1.5		μ s
$V_{INPOFFSET}$	Input offset including reference ladder error	-18		18	mV
V_{HYST}	Optional hysteresis		43		mV
$t_{STARTUP}$	Startup time for LPCOMP	10	32	62	μ s

11.9 NFCT Electrical specification

11.9.1 NFCT Electrical Specification

Symbol	Description	Min.	Typ.	Max.	Units
f_c	Frequency of operation	12.55	13.56	13.57	MHz
C_{MI}	Carrier modulation index	95			%
DR	Data Rate		106		kbps
V_{sense}	Peak differential field detect threshold level on NFC1-NFC2, with input being high impedance in sense mode		1.3		Vp
I_{max}	Maximum input current on NFCT pins		80	130	mA

11.9.2 NFCT Timing Parameters

Symbol	Description	Min.	Typ.	Max.	Units
$t_{activate}$	Time from task_ACTIVATE in SENSE or DISABLE state to ACTIVATE_A or IDLE state, excluding voltage supply and oscillator startup times			625	μ s
t_{sense}	Time from remote field is present in SENSE mode to FIELDDETECTED event is asserted		7.2		μ s

Figure 204: NFCT timing parameters (Shortcuts for FIELDDETECTED and FIELDLOST are disabled)

11.10 OSCILLATORS Electrical specification

11.10.1 32 MHz crystal oscillator (HFXO)

Symbol	Description	Min.	Typ.	Max.	Units
f_{HFXO}	External crystal frequency		32		MHz
$f_{\text{TOL_HFXO}}$	Frequency tolerance requirement for 2.4 GHz proprietary radio applications			± 60	ppm
$f_{\text{TOL_HFXO_BLE}}$	Frequency tolerance requirement, Bluetooth Low Energy applications			± 40	ppm
$C_{\text{L_HFXO}}$	Load capacitance	6		9	pF
$P_{\text{D_HFXO}}$	Drive level			100	μW
$C_{\text{PIN_HFXO}}$	Input capacitance on XC1 and XC2 pins with internal capacitor disabled (INTCAP=0)		3.1		pF
$I_{\text{STBY_X32M_X2}}$	Core standby current for a given 2.0x1.6 mm crystal: $CL_{\text{HFXO}}=8$ pF $CO_{\text{HFXO}}=0.74$ pF $LM_{\text{HFXO}}=9.4$ mH $RS_{\text{HFXO}}=35$ Ω		34		μA
$I_{\text{START_X32M_X2}}$	Average startup current during first 1ms for a given 2.0x1.6 mm crystal		0.36		mA
$t_{\text{POWERUP_X32M_X2}}$	Power-up time for a given 2.0x1.6 mm crystal, generating XOSTARTED event		200		μs
$t_{\text{POWERUP_X32M_TUNED_X2}}$	Power-up time for a given 2.0x1.6 mm crystal, generating XOTUNED event		300		μs
$I_{\text{STBY_X32M_X3}}$	Core standby current for a given 1.2x1.0 mm crystal: $CL_{\text{HFXO}}=8$ pF $CO_{\text{HFXO}}=0.42$ pF $LM_{\text{HFXO}}=22.7$ mH $RS_{\text{HFXO}}=100$ Ω		63		μA
$I_{\text{START_X32M_X3}}$	Average startup current during first 1ms for a given 1.2x1.0 mm crystal		0.38		mA
$t_{\text{POWERUP_X32M_X3}}$	Power-up time for a given 1.2x1.0 mm crystal, generating XOSTARTED event		415		μs
$t_{\text{POWERUP_X32M_TUNED_X3}}$	Power-up time for a given 1.2x1.0 mm crystal, generating XOTUNED event		700		μs

11.10.2 32.768 kHz crystal oscillator (LFXO)

Symbol	Description	Min.	Typ.	Max.	Units
f_{LFXO}	External crystal frequency		32.768		kHz
$f_{TOL_LFXO_BLE}$	Frequency tolerance requirement, Bluetooth Low Energy applications			±500	ppm
$f_{TOL_LFXO_ANT}$	Frequency tolerance requirement for ANT applications			±50	ppm
C_{L_LFXO}	Load capacitance	6		9	pF
C_{O_LFXO}	Shunt capacitance		1.0	2.0	pF
R_{S_LFXO}	Equivalent series resistance			100	kΩ
P_{D_LFXO}	Drive level			0.5	μW
C_{pin}	Input capacitance on XL1 and XL2 pins with internal capacitor disabled (INTCAP=0)		3		pF
$V_{AMP,IN,XO,LOW}$	Peak-to-peak amplitude for external low swing clock. Input signal must not swing outside supply rails.	100		500	mV

11.11 PPI Electrical specification

11.11.1 Typical PPI latencies

Symbol	Description	Min.	Typ.	Max.	Units
t_{PPI}	PPI latency between same power-domain peripherals in RUN state (i.e. PCLK's are running)		2		cycles

11.12 PDM Electrical specification

11.12.1 PDM Electrical Specification

Symbol	Description	Min.	Typ.	Max.	Units
$f_{PDM,CLK,64}$	PDM clock speed. PDMCLKCTRL = Default (Setting needed for 16 kHz sample frequency @ RATIO = Ratio64)		1.032		MHz
$f_{PDM,CLK,80}$	PDM clock speed. PDMCLKCTRL = 1280K (Setting needed for 16 kHz sample frequency @ RATIO = Ratio80)		1.280		MHz
$t_{PDM,JITTER}$	Jitter in PDM clock output				ns
$T_{dPDM,CLK}$	PDM clock duty cycle	40	50	60	%
$t_{PDM,DATA}$	Decimation filter delay			5	ms
$t_{PDM,s}$	Data setup time	35			ns
$t_{PDM,h}$	Data hold time	0			ns
$G_{PDM,default}$	Default (reset) absolute gain of the PDM module		0		dB

Figure 205: PDM timing diagram

11.13 QDEC Electrical specification

11.13.1 QDEC Electrical Specification

Symbol	Description	Min.	Typ.	Max.	Units
t_{SAMPLE}	Time between sampling signals from quadrature decoder	128		131072	μs
t_{LED}	Time from LED is turned on to signals are sampled	0		511	μs

11.14 RADIO Electrical specification

11.14.1 General radio characteristics

Symbol	Description	Min.	Typ.	Max.	Units
f_{OP}	Operating frequencies	2400		2500	MHz
$f_{\text{CH,SP}}$	Channel spacing		1.0		MHz
$f_{\text{DELTA,BLE,1M}}$	Frequency deviation @ Bluetooth LE 1 Mbps		± 250		kHz
$f_{\text{DELTA,BLE,2M}}$	Frequency deviation @ Bluetooth LE 2 Mbps		± 500		kHz
$f_{\text{DELTA,4M}}$	Frequency deviation @ 4 Mbps		± 1000		kHz
f_{skBPS}	On-the-air data rate	125		4000	kbps
$f_{\text{chip, IEEE 802.15.4}}$	Chip rate in IEEE 802.15.4 mode		2000		kchip/s

11.14.2 Radio current consumption (transmitter)

Symbol	Description	Min.	Typ.	Max.	Units
$I_{\text{TX,MaxdBm,CSP}}$	TX only run current for CSP package, P_{RF} at maximum power setting		9.7		mA
$I_{\text{TX,0dBm}}$	TX only run current, $P_{\text{RF}} = 0 \text{ dBm}$		3.9		mA
$I_{\text{TX,MINUS26dBm}}$	TX only run current $P_{\text{RF}} = -26 \text{ dBm}$		1.5		mA

11.14.3 Radio current consumption (Receiver)

Symbol	Description	Min.	Typ.	Max.	Units
$I_{RX,1M}$	RX only run current, 1 Mbps/1 Mbps Bluetooth LE mode		2.1		mA

11.14.4 Transmitter specification

Symbol	Description	Min.	Typ.	Max.	Units
$P_{RF,CSP}$	Maximum output power for CSP package		8		dBm
P_{RFCR}	RF power accuracy	-1		1	dB
$P_{RF1,BLE1M,2MHZ}$	Adjacent Channel Transmit Power 2 MHz (1 Mbps Bluetooth LE mode)		-48		dBc
$P_{RF1,BLE1M,3MHZ}$	Adjacent Channel Transmit Power 3 MHz (1 Mbps Bluetooth LE mode)		-54		dBc
$P_{RF1,BLE2M,4MHZ}$	Adjacent Channel Transmit Power 4 MHz (2 Mbps Bluetooth LE mode)		-51		dBc
$P_{RF1,BLE2M,6MHZ}$	Adjacent Channel Transmit Power 6 MHz (2 Mbps Bluetooth LE mode)		-56		dBc
$P_{harm2nd, IEEE 802.15.4}$	2nd harmonics in IEEE 802.15.4 mode		-56		dBm
$P_{harm3rd, IEEE 802.15.4}$	3rd harmonics in IEEE 802.15.4 mode		-67		dBm

Figure 206: Output power, 1 Mbps Bluetooth low energy mode, at maximum TXPOWER setting (typical values)

Figure 207: Output power, 1 Mbps Bluetooth low energy mode, at 0 dBm setting (typical values)

11.14.5 Receiver operation

Symbol	Description	Min.	Typ.	Max.	Units
P _{RX,MAX}	Maximum received signal strength at < 0.1% PER		0		dBm
P _{SENS,IT,SP,1M,BLE}	Sensitivity, 1 Mbps Bluetooth LE ideal transmitter, packet length ≤ 37 bytes BER = 1E-3 ⁴		-95.5		dBm
P _{SENS,IT,LP,1M,BLE}	Sensitivity, 1 Mbps Bluetooth LE ideal transmitter, packet length ≥ 128 bytes BER = 1E-4		-94		dBm
P _{SENS,IT,SP,2M,BLE}	Sensitivity, 2 Mbps Bluetooth LE ideal transmitter, packet length ≤ 37 bytes		-93		dBm
P _{SENS,IT,BLE LE125k}	Sensitivity, 125 kbps Bluetooth LE mode		-103		dBm
P _{SENS,IT,BLE LE500k}	Sensitivity, 500 kbps Bluetooth LE mode		-98		dBm
P _{SENS,IEEE 802.15.4}	Sensitivity in IEEE 802.15.4 mode		-101		dBm

⁴ As defined in the *Bluetooth Core Specification v4.0 Volume 6: Core System Package (Low Energy Controller Volume)*.

Figure 208: Sensitivity, 1 Mbps Bluetooth LE ideal transmitter, packet length ≤ 37 bytes BER = $1E-3$ (typical values)

11.14.6 RX selectivity

RX selectivity with equal modulation on interfering signal⁵

Symbol	Description	Min.	Typ.	Max.	Units
C/I _{1MBLE,co-channel}	1 Mbps Bluetooth LE mode, co-channel interference		5		dB
C/I _{1MBLE,-1MHz}	1 Mbps Bluetooth LE mode, Adjacent (-1 MHz) interference		-3		dB
C/I _{1MBLE,+1MHz}	1 Mbps Bluetooth LE mode, Adjacent (+1 MHz) interference		-7		dB
C/I _{1MBLE,-2MHz}	1 Mbps Bluetooth LE mode, Adjacent (-2 MHz) interference		-29		dB
C/I _{1MBLE,+2MHz}	1 Mbps Bluetooth LE mode, Adjacent (+2 MHz) interference		-43		dB
C/I _{1MBLE,>3MHz}	1 Mbps Bluetooth LE mode, Adjacent (≥ 3 MHz) interference		-46		dB
C/I _{1MBLE,image}	Image frequency interference		-29		dB
C/I _{1MBLE,image,1MHz}	Adjacent (1 MHz) interference to in-band image frequency		-36		dB
C/I _{2MBLE,co-channel}	2 Mbps Bluetooth LE mode, co-channel interference		5		dB
C/I _{2MBLE,-2MHz}	2 Mbps Bluetooth LE mode, Adjacent (-2 MHz) interference		-4		dB
C/I _{2MBLE,+2MHz}	2 Mbps Bluetooth LE mode, Adjacent (+2 MHz) interference		-7		dB
C/I _{2MBLE,-4MHz}	2 Mbps Bluetooth LE mode, Adjacent (-4 MHz) interference		-28		dB
C/I _{2MBLE,+4MHz}	2 Mbps Bluetooth LE mode, Adjacent (+4 MHz) interference		-45		dB
C/I _{2MBLE,>6MHz}	2 Mbps Bluetooth LE mode, Adjacent (≥ 6 MHz) interference		-47		dB
C/I _{2MBLE,image}	Image frequency interference		-28		dB
C/I _{2MBLE,image,2MHz}	Adjacent (2 MHz) interference to in-band image frequency		-35		dB
C/I _{125k BLE LR,co-channel}	125 kbps Bluetooth LE LR mode, co-channel interference		1		dB
C/I _{125k BLE LR,-1MHz}	125 kbps Bluetooth LE LR mode, Adjacent (-1 MHz) interference		-13		dB
C/I _{125k BLE LR,+1MHz}	125 kbps Bluetooth LE LR mode, Adjacent (+1 MHz) interference		-17		dB
C/I _{125k BLE LR,-2MHz}	125 kbps Bluetooth LE LR mode, Adjacent (-2 MHz) interference		-36		dB

⁵ Desired signal level at $P_{IN} = -67$ dBm. One interferer is used, having equal modulation as the desired signal. The input power of the interferer where the sensitivity equals BER = 0.1% is presented.

Symbol	Description	Min.	Typ.	Max.	Units
$C/I_{125k\ BLE\ LR,+2MHz}$	125 kbps Bluetooth LE LR mode, Adjacent (+2 MHz) interference		-52		dB
$C/I_{125k\ BLE\ LR,>3MHz}$	125 kbps Bluetooth LE LR mode, Adjacent (≥ 3 MHz) interference		-55		dB
$C/I_{125k\ BLE\ LR,image}$	Image frequency interference		-35		dB

Figure 209: Selectivity Bluetooth Low Energy (Typical performance; wanted signal at channel 2440 MHz and -67 dBm input level)

11.14.7 RX intermodulation

RX intermodulation. Desired signal level at $P_{IN} = -64$ dBm. Two interferers with equal input power are used. The interferer closest in frequency is not modulated, the other interferer is modulated equal with the desired signal. The input power of the interferers where the sensitivity equals $BER = 1E-3$ is presented.

Symbol	Description	Min.	Typ.	Max.	Units
$P_{IMD,5TH,1M,BLE}$	IMD performance, Bluetooth LE 1 Mbps, 5th offset channel, packet length ≤ 37 bytes		-29		dBm
$P_{IMD,5TH,2M,BLE}$	IMD performance, Bluetooth LE 2 Mbps, 5th offset channel, packet length ≤ 37 bytes		-29		dBm

11.14.8 Radio timing

Symbol	Description	Min.	Typ.	Max.	Units
$t_{TXEN,BLE,1M}$	Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps Bluetooth LE and 150 μs TIFS)		140		μs
$t_{TXEN,FAST,BLE,1M}$	Time between TXEN task and READY event after channel FREQUENCY configured (1 Mbps Bluetooth LE with fast ramp-up and 150 μs TIFS)		40		μs
$t_{TXDIS,BLE,1M}$	When in TX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit		2		μs

Symbol	Description	Min.	Typ.	Max.	Units
$t_{RXEN,BLE,1M}$	Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps Bluetooth LE)		134		μs
$t_{RXEN,FAST,BLE,1M}$	Time between the RXEN task and READY event after channel FREQUENCY configured (1 Mbps Bluetooth LE with fast ramp-up)		40		μs
$t_{RXDIS,BLE,1M}$	When in RX, delay between DISABLE task and DISABLED event for MODE = Nrf_1Mbit and MODE = Ble_1Mbit		1		μs
$t_{TXDIS,BLE,2M}$	When in TX, delay between DISABLE task and DISABLED event for MODE = Nrf_2Mbit and MODE = Ble_2Mbit		2		μs
$t_{RXDIS,BLE,2M}$	When in RX, delay between DISABLE task and DISABLED event for MODE = Nrf_2Mbit and MODE = Ble_2Mbit		1		μs
$t_{TXEN,IEEE\ 802.15.4}$	Time between TXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 mode)		130		μs
$t_{TXEN,FAST,IEEE\ 802.15.4}$	Time between TXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 mode with fast ramp-up)		40		μs
$t_{TXDIS,IEEE\ 802.15.4}$	When in TX, delay between DISABLE task and DISABLED event (IEEE 802.15.4 mode)		18		μs
$t_{RXEN,IEEE\ 802.15.4}$	Time between the RXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 mode)		130		μs
$t_{RXEN,FAST,IEEE\ 802.15.4}$	Time between the RXEN task and READY event after channel FREQUENCY configured (IEEE 802.15.4 mode with fast ramp-up)		40		μs
$t_{RXDIS,IEEE\ 802.15.4}$	When in RX, delay between DISABLE task and DISABLED event (IEEE 802.15.4 mode)		0.2		μs
$t_{RX-to-TX\ turnaround,\ IEEE\ 802.15.4}$	Maximum RX-to-TX turnaround time in IEEE 802.15.4 mode		17		μs

11.14.9 Received signal strength indicator (RSSI) specifications

Symbol	Description	Min.	Typ.	Max.	Units
$RSSI_{ACC}$	RSSI accuracy in the range -90 to -30 dBm		± 2		dB
$RSSI_{RESOLUTION}$	RSSI resolution		1		dB
$RSSI_{PERIOD}$	RSSI sampling time from RSSISTART task		0.25		μs
$RSSI_{SETTLE}$	RSSI settling time after signal level change		15	20	μs

Figure 210: RSSI reading versus input level. Typical values.

11.14.10 Jitter

Symbol	Description	Min.	Typ.	Max.	Units
$t_{\text{DISABLED JITTER}}$	Jitter on DISABLED event relative to END event when shortcut between END and DISABLE is enabled		0.25		μs
$t_{\text{READY JITTER}}$	Jitter on READY event relative to TXEN and RXEN task		0.25		μs

11.14.11 IEEE 802.15.4 mode energy detection constants

Symbol	Description	Min.	Typ.	Max.	Units
ED_RSSISCALE	Scaling value when converting between hardware-reported value and dBm	4	4	4	
ED_RSSIOFFS	Offset value when converting between hardware-reported value and dBm	-92	-92	-92	

11.15 REGULATORS Electrical specification

11.15.1 Recommended operating conditions

Symbol	Description	Min.	Typ.	Max.	Units
V_{DD}	VDD supply voltage.	1.7		3.6	V

11.15.2 Power-fail comparator

Symbol	Description	Min.	Typ.	Max.	Units
V _{POF}	Voltage level warning thresholds (falling supply voltage). Levels are configurable between min. and max. in increments of 100 mV.	1.7		3.2	V
V _{POFTOL}	Threshold voltage tolerance.	-2		2	%
V _{POFHYST}	Threshold voltage hysteresis.	40	50	55	mV
V _{BOR,OFF}	Brownout reset voltage range System OFF mode. Brownout only applies to the voltage on VDD.	1.56		1.64	V
V _{BOR,ON}	Brownout reset voltage range System ON mode. Brownout only applies to the voltage on VDD.	1.57		1.64	V

11.16 RESET Electrical specification

11.16.1 Startup times

Symbol	Description	Min.	Typ.	Max.	Units
t _{POR,10us}	Time measured as time in power-on reset after supply reaches minimum operating voltage, with VDD rise time from 1 μ s to 100ms.		0.2	2	ms

11.17 RRAMC Electrical specification

11.17.1 RRAM programming

Symbol	Description	Min.	Typ.	Max.	Units
n _{ENDURANCE}	Number of times a 128-bit data unit can be written	10000			

11.18 SAADC Electrical specification

11.18.1 SAADC Electrical Specification

Symbol	Description	Min.	Typ.	Max.	Units
DNL ₁₀	Differential non-linearity, 10-bit resolution	1	<3		LSB11b
V _{OS}	Differential offset error (calibrated), 10-bit resolution ^a	-5	0	5	LSB10b
f _{SAMPLE}	Maximum sampling rate			2000	kHz
f _{BW,NS1}	Input signal bandwidth for NOISESHAPE=NS1			40	kHz
f _{BW,NS2}	Input signal bandwidth for NOISESHAPE=NS2			20	kHz
t _{ACQ,2k}	Acquisition time (configurable), source Resistance <= 2kOhm		0.25		μ s
t _{ACQ,10k}	Acquisition time (configurable), source Resistance <= 10kOhm		0.5		μ s
t _{ACQ,20k}	Acquisition time (configurable), source Resistance <= 20kOhm		1		μ s
t _{ACQ,40k}	Acquisition time (configurable), source Resistance <= 40kOhm		2		μ s
t _{ACQ,100k}	Acquisition time (configurable), source Resistance <= 100kOhm		5		μ s
t _{ACQ,200k}	Acquisition time (configurable), source Resistance <= 200kOhm		10		μ s

^a Digital output code at zero volt differential input.

Symbol	Description	Min.	Typ.	Max.	Units
$t_{ACQ,400k}$	Acquisition time (configurable), source Resistance $\leq 400k\Omega$		20		μs
$t_{ACQ,800k}$	Acquisition time (configurable), source Resistance $\leq 800k\Omega$		40		μs
t_{CONV}	Conversion time		0.5		μs
$E_{G2/5}$	Error ^b for Gain = 2/5	-1.2		1.2	%
$E_{G1/2}$	Error ^b for Gain = 1/2	-1.2		1.2	%
E_{G1}	Error ^b for Gain = 1	-1.2		1.2	%
E_{G2}	Error ^b for Gain = 2	-1.2		1.2	%
R_{INPUT}	Input resistance for input frequencies in range 0-200 kHz		735		k Ω
R_{INPUT}	Input resistance for input frequencies in range 200 kHz - 1 MHz	157			k Ω
E_{NOB}	Effective number of bits, differential mode, 12-bit resolution, 1/1 gain, 250 ns acquisition time, HFXO, 2 Msps		9		Bit
S_{NDR}	Peak signal to noise and distortion ratio, differential mode, 12-bit resolution, 1/1 gain, 250 ns acquisition time, HFXO, 2 Msps		56		dB
S_{FDR}	Spurious free dynamic range, differential mode, 12-bit resolution, 1/1 gain, 250 ns acquisition time, HFXO, 2 Msps		60		dBc

11.19 SPIM Electrical specification

11.19.1 Timing specifications

Symbol	Description	Min.	Typ.	Max.	Units
f_{SPIM}	Bit rates for SPIM ⁶			8	Mbps
$f_{SPIM,HS}$	Bit rates for high-speed SPIM instances ⁷			32 ⁸	Mbps
$t_{SPIM,START}$	Time from START task to transmission started		1		μs
$t_{SPIM,CCLK}$	SCK period	31.25			ns
$t_{SPIM,RSCK,LD}$	SCK rise time, standard drive ⁹			$t_{RF,25pF}$	
$t_{SPIM,RSCK,HD}$	SCK rise time, high drive ⁹			$t_{HRF,25pF}$	
$t_{SPIM,FSCK,LD}$	SCK fall time, standard drive ⁹			$t_{RF,25pF}$	
$t_{SPIM,FSCK,HD}$	SCK fall time, high drive ⁹			$t_{HRF,25pF}$	
$t_{SPIM,WHCK}$	SCK high time ⁹	$(t_{CCLK}/2) -$ $t_{RSCK} - 1.5$ ns			
$t_{SPIM,WLCK}$	SCK low time ⁹	$(t_{CCLK}/2) -$ $t_{FSCK} - 1.5$ ns			

^b Does not include temperature drift

⁶ High bit rates may require GPIOs to be set as High Drive or Extra High Drive, see GPIO chapter for more details.

⁷ High bit rates may require GPIOs to be set as High Drive or Extra High Drive, see GPIO chapter for more details.

⁸ For SPIM00 using GPIO port P2.

⁹ At 25pF load, including GPIO pin capacitance, see GPIO spec.

Figure 211: SPIM timing diagram

11.19.2 Timing specifications for GPIO port P0 using Standard drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIM,SUMI}$	SDI to CLK edge setup time	51			ns
$t_{SPIM,HMI}$	CLK edge to SDI hold time	0			ns
$t_{SPIM,VMO}$	CLK edge to SDO valid			12	ns
$t_{SPIM,HMO}$	SDO hold time after CLK edge	-4			ns

11.19.3 Timing specifications for GPIO port P0 using High drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIM,SUMI}$	SDI to CLK edge setup time	48			ns
$t_{SPIM,HMI}$	CLK edge to SDI hold time	0			ns
$t_{SPIM,VMO}$	CLK edge to SDO valid			15	ns
$t_{SPIM,HMO}$	SDO hold time after CLK edge	-6			ns

11.19.4 Timing specifications for GPIO port P1 using Standard drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIM,SUMI}$	SDI to CLK edge setup time	38			ns
$t_{SPIM,HMI}$	CLK edge to SDI hold time	0			ns
$t_{SPIM,VMO}$	CLK edge to SDO valid			5	ns
$t_{SPIM,HMO}$	SDO hold time after CLK edge	-2			ns

11.19.5 Timing specifications for GPIO port P1 using High drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIM,SUMI}$	SDI to CLK edge setup time	34			ns
$t_{SPIM,HMI}$	CLK edge to SDI hold time	0			ns
$t_{SPIM,VMO}$	CLK edge to SDO valid			8	ns
$t_{SPIM,HMO}$	SDO hold time after CLK edge	-6			ns

11.19.6 Timing specifications for GPIO port P2 using Standard drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIM,SUMI}$	SDI to CLK edge setup time	38			ns
$t_{SPIM,HMI}$	CLK edge to SDI hold time	0			ns
$t_{SPIM,VMO}$	CLK edge to SDO valid			5	ns
$t_{SPIM,HMO}$	SDO hold time after CLK edge	-2			ns

11.19.7 Timing specifications for GPIO port P2 using High drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIM,SUMI}$	SDI to CLK edge setup time	34			ns
$t_{SPIM,HMI}$	CLK edge to SDI hold time	0			ns
$t_{SPIM,VMO}$	CLK edge to SDO valid			8	ns
$t_{SPIM,HMO}$	SDO hold time after CLK edge	-6			ns

11.19.8 Timing specifications for GPIO port P2 using Extra high drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIM,SUMI}$	SDI to CLK edge setup time	13			ns
$t_{SPIM,HMI}$	CLK edge to SDI hold time	0			ns
$t_{SPIM,VMO}$	CLK edge to SDO valid			2	ns
$t_{SPIM,HMO}$	SDO hold time after CLK edge	-1			ns

11.19.9 Timing specifications for GPIO port P3 using Standard drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIM,SUMI}$	SDI to CLK edge setup time	38			ns
$t_{SPIM,HMI}$	CLK edge to SDI hold time	0			ns
$t_{SPIM,VMO}$	CLK edge to SDO valid			5	ns
$t_{SPIM,HMO}$	SDO hold time after CLK edge	-3			ns

11.19.10 Timing specifications for GPIO port P3 using High drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIM,SUMI}$	SDI to CLK edge setup time	35			ns
$t_{SPIM,HMI}$	CLK edge to SDI hold time	0			ns
$t_{SPIM,VMO}$	CLK edge to SDO valid			7	ns
$t_{SPIM,HMO}$	SDO hold time after CLK edge	-5			ns

11.20 SPIS Electrical specification

11.20.1 SPIS slave interface electrical specifications

Symbol	Description	Min.	Typ.	Max.	Units
f_{SPIS}	Bit rates for SPIS ¹⁰			8 ¹¹	Mbps
$t_{SPIS,START}$	Time from RELEASE task to receive/transmit (CSN active)		1		μs

11.20.2 Serial Peripheral Interface Slave (SPIS) timing specifications

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,CSCKIN}$	SCK input period	125			ns
$t_{SPIS,RFSCCKIN}$	SCK input rise/fall time			30	ns
$t_{SPIS,WHSCCKIN}$	SCK input high time	30			ns
$t_{SPIS,WLSCCKIN}$	SCK input low time	30			ns
$t_{SPIS,SUCSN}$	CSN to CLK setup time	1000 ¹²			ns
$t_{SPIS,HCSN}$	CLK to CSN hold time	1000			ns
$t_{SPIS,ASA}$	CSN to SDO driven			70	ns
$t_{SPIS,ASO}$	CSN to SDO valid ¹³			1000	ns
$t_{SPIS,DISSO}$	CSN to SDO disabled ¹³			70	ns
$t_{SPIS,CWH}$	CSN inactive time	300			ns

¹⁰ High bit rates may require GPIOs to be set as High Drive, see GPIO chapter for more details.

¹¹ The actual maximum data rate depends on the master's CLK to SDO and SDI setup and hold timings.

¹² Excluding any start-up delay for the high frequency clock in low power mode.

¹³ At 25pF load, including GPIO capacitance, see GPIO spec.

Figure 212: SPIS timing diagram, CPHA = 0

Figure 213: SPIS timing diagram, CPHA = 1

Figure 214: Common SPIM and SPIS timing diagram

11.20.3 Timing specifications for GPIO port P0 using Standard drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,VSO}$	CLK edge to SDO valid			46	ns
$t_{SPIS,HSO}$	SDO hold time after CLK edge	5			ns
$t_{SPIS,SUSI}$	SDI to CLK edge setup time	17			ns
$t_{SPIS,HSI}$	CLK edge to SDI hold time	1			ns

11.20.4 Timing specifications for GPIO port P0 using High drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,VSO}$	CLK edge to SDO valid			43	ns
$t_{SPIS,HSO}$	SDO hold time after CLK edge	5			ns
$t_{SPIS,SUSI}$	SDI to CLK edge setup time	17			ns
$t_{SPIS,HSI}$	CLK edge to SDI hold time	1			ns

11.20.5 Timing specifications for GPIO port P1 using Standard drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,VSO}$	CLK edge to SDO valid			37	ns
$t_{SPIS,HSO}$	SDO hold time after CLK edge	4			ns
$t_{SPIS,SUSI}$	SDI to CLK edge setup time	5			ns
$t_{SPIS,HSI}$	CLK edge to SDI hold time	2			ns

11.20.6 Timing specifications for GPIO port P1 using High drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,VSO}$	CLK edge to SDO valid			33	ns
$t_{SPIS,HSO}$	SDO hold time after CLK edge	4			ns
$t_{SPIS,SUSI}$	SDI to CLK edge setup time	5			ns
$t_{SPIS,HSI}$	CLK edge to SDI hold time	2			ns

11.20.7 Timing specifications for GPIO port P2 using Standard drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,VSO}$	CLK edge to SDO valid			37	ns
$t_{SPIS,HSO}$	SDO hold time after CLK edge	4			ns
$t_{SPIS,SUSI}$	SDI to CLK edge setup time	5			ns
$t_{SPIS,HSI}$	CLK edge to SDI hold time	0			ns

11.20.8 Timing specifications for GPIO port P2 using High drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,VSO}$	CLK edge to SDO valid			33	ns
$t_{SPIS,HSO}$	SDO hold time after CLK edge	4			ns
$t_{SPIS,SUSI}$	SDI to CLK edge setup time	5			ns
$t_{SPIS,HSI}$	CLK edge to SDI hold time	0			ns

11.20.9 Timing specifications for GPIO port P2 using Extra high drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,VSO}$	CLK edge to SDO valid			13	ns
$t_{SPIS,HSO}$	SDO hold time after CLK edge	3			ns
$t_{SPIS,SUSI}$	SDI to CLK edge setup time	3			ns
$t_{SPIS,HSI}$	CLK edge to SDI hold time	1			ns

11.20.10 Timing specifications for GPIO port P3 using Standard drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,VSO}$	CLK edge to SDO valid			37	ns
$t_{SPIS,HSO}$	SDO hold time after CLK edge	5			ns
$t_{SPIS,SUSI}$	SDI to CLK edge setup time	5			ns
$t_{SPIS,HSI}$	CLK edge to SDI hold time	0			ns

11.20.11 Timing specifications for GPIO port P3 using High drive strength

Symbol	Description	Min.	Typ.	Max.	Units
$t_{SPIS,VSO}$	CLK edge to SDO valid			34	ns
$t_{SPIS,HSD}$	SDO hold time after CLK edge	5			ns
$t_{SPIS,SUSI}$	SDI to CLK edge setup time	5			ns
$t_{SPIS,HSI}$	CLK edge to SDI hold time	1			ns

11.21 SWDP Electrical specification

11.21.1 SW-DP

Symbol	Description	Min.	Typ.	Max.	Units
R_{pull}	Internal SWDIO and SWDCLK pull-up/pull-down resistance		14		k Ω
f_{SWDCLK}	SWDCLK frequency	0.125		20	MHz
t_{SUI}	SWDIO input setup before SWDCLK	17			ns
t_{HI}	SWDIO input hold after SWDCLK	2			ns
t_{VO}	SWDCLK to SWDIO output valid			36	ns
t_{HO}	SWDIO output hold after SWDCLK	4			ns

Figure 215: SWD timing diagram

11.21.2 Trace port

Symbol	Description	Min.	Typ.	Max.	Units
T_{cyc}	Clock period, as defined by Arm in Embedded Trace Macrocell Architecture Specification	15.625		250	ns

11.22 TEMP Electrical specification

11.22.1 Temperature Sensor Electrical Specification

Symbol	Description	Min.	Typ.	Max.	Units
t_{TEMP}	Time required for temperature measurement		36		μs
$T_{TEMP,RANGE}$	Temperature sensor range	-20		70	$^{\circ}C$
$T_{TEMP,ACC}$	Temperature sensor accuracy over $T_{TEMP,RANGE}$ range	-5		5	$^{\circ}C$
$T_{TEMP,RANGE,EXT}$	Temperature sensor extended temperature range	-40		85	$^{\circ}C$
$T_{TEMP,ACC,EXT}$	Temperature sensor accuracy over $T_{TEMP,RANGE,EXT}$ range	-7		7	$^{\circ}C$
$T_{TEMP,RES}$	Temperature sensor resolution		0.25		$^{\circ}C$
$T_{TEMP,STB}$	Sample to sample stability at constant device temperature			± 0.25	$^{\circ}C$
$T_{TEMP,OFFST}$	Sample offset at $25^{\circ}C$	-3		3	$^{\circ}C$

11.23 TDM Electrical specification

11.23.1 TDM timing specification

Symbol	Description	Min.	Typ.	Max.	Units
f_{MCK}	MCK frequency			12288	kHz
f_{SCK}	SCK frequency			12288	kHz

Figure 216: TDM timing diagram

11.23.2 Timing specifications for Slave mode

Symbol	Description	Min.	Typ.	Max.	Units
t_{S_SDIN}	SDIN setup time before SCK rising	6			ns
t_{H_SDIN}	SDIN hold time after SCK rising	0			ns
t_{S_SDOUT}	SCK falling edge to SDOUT valid			31	ns
t_{H_SDOUT}	SDOUT hold time after SCK falling	5			ns

11.23.3 Timing specifications for Master mode

Symbol	Description	Min.	Typ.	Max.	Units
t_{S_SDIN}	SDIN setup time before SCK rising	36			ns
t_{H_SDIN}	SDIN hold time after SCK rising	0			ns
t_{S_SDOUT}	SCK falling edge to SDOUT valid			7	ns
t_{H_SDOUT}	SDOUT hold time after SCK falling	4			ns

11.24 TWIM Electrical specification

11.24.1 TWIM interface electrical specifications

Symbol	Description	Min.	Typ.	Max.	Units
$f_{TWIM,SCL}$	Bit rates for TWIM ¹⁴	100		1000	kbps
$t_{TWIM,START}$	Time from STARTRX/STARTTX task to transmission started		1.5		μs

11.24.2 Two Wire Interface Master (TWIM) timing specifications

Symbol	Description	Min.	Typ.	Max.	Units
t_{TWIM,SU_DATI}	Input data setup time before positive edge on SCL – all modes	20			ns
t_{TWIM,HD_DATO}	Output data hold time after negative edge on SCL – 100, 250 and 400 kbps	500		625	ns
$t_{TWIM,HD_STA,100kbps}$	TWIM master hold time for START and repeated START condition, 100 kbps	10000			ns
$t_{TWIM,HD_STA,250kbps}$	TWIM master hold time for START and repeated START condition, 250 kbps	4000			ns
$t_{TWIM,HD_STA,400kbps}$	TWIM master hold time for START and repeated START condition, 400 kbps	2400			ns
$t_{TWIM,SU_STO,100kbps}$	TWIM master setup time from SCL high to STOP condition, 100 kbps	5000			ns
$t_{TWIM,SU_STO,250kbps}$	TWIM master setup time from SCL high to STOP condition, 250 kbps	2000			ns
$t_{TWIM,SU_STO,400kbps}$	TWIM master setup time from SCL high to STOP condition, 400 kbps	1250			ns
$t_{R,100kbps}$	Rise time of both SDA and SCL signals, 100kbps			1000	ns
$t_{F,100kbps}$	Fall time of both SDA and SCL signals, 100kbps			300	ns
$t_{R,400kbps}$	Rise time of both SDA and SCL signals, 400kbps			300	ns
$t_{F,400kbps}$	Fall time of both SDA and SCL signals, 400kbps			300	ns
$t_{TWIM,BUF,100kbps}$	TWIM master bus free time between STOP and START conditions, 100 kbps	5200			ns
$t_{TWIM,BUF,250kbps}$	TWIM master bus free time between STOP and START conditions, 250 kbps	2200			ns
$t_{TWIM,BUF,400kbps}$	TWIM master bus free time between STOP and START conditions, 400 kbps	1500			ns

Figure 217: TWIM timing diagram, 1 byte transaction

¹⁴ High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see [GPIO — General purpose input/output](#) on page 292 for more details.

11.25 TWIS Electrical specification

11.25.1 TWIS slave timing specifications

Symbol	Description	Min.	Typ.	Max.	Units
$f_{\text{TWIS,SCL}}$	Bit rates for TWIS ¹⁵	100		400	kbps
$t_{\text{TWIS,START}}$	Time from PREPARERX/PREPARETX task to ready to receive/transmit		1.5		μs
$t_{\text{TWIS,SU_DATI}}$	Input data setup time before positive edge on SCL – all modes	20			ns
$t_{\text{TWIS,HD_DATI}}$	Input data hold time after negative edge on SCL – all modes	0			ns
$t_{\text{TWIS,HD_DATO}}$	Output data hold time after negative edge on SCL – all modes	350		600	ns
$t_{\text{TWIS,HD_STA,100kbps}}$	TWI slave hold time from for START condition (SDA low to SCL low), 100 kbps	500			ns
$t_{\text{TWIS,HD_STA,400kbps}}$	TWI slave hold time from for START condition (SDA low to SCL low), 400 kbps	500			ns
$t_{\text{TWIS,SU_STO,100kbps}}$	TWI slave setup time from SCL high to STOP condition, 100 kbps	500			ns
$t_{\text{TWIS,SU_STO,400kbps}}$	TWI slave setup time from SCL high to STOP condition, 400 kbps	500			ns
$t_{\text{TWIS,BUF,100kbps}}$	TWI slave bus free time between STOP and START conditions, 100 kbps	500			ns
$t_{\text{TWIS,BUF,400kbps}}$	TWI slave bus free time between STOP and START conditions, 400 kbps	500			ns

Figure 218: TWIS timing diagram, 1 byte transaction

11.26 UARTE Electrical specification

11.26.1 UARTE electrical specification

Symbol	Description	Min.	Typ.	Max.	Units
f_{UARTE}	Baud rate for UARTE			1000	kbps
$f_{\text{UARTE,HS}}$	Bit rates for high-speed UARTE instances ¹⁶			4000	kbps
$t_{\text{UARTE,CTSH}}$	CTS high time	0.5			μs
$t_{\text{UARTE,START}}$	Time from STARTRX/STARTTX task to transmission started		0.5		μs

¹⁵ High bit rates or stronger pull-ups may require GPIOs to be set as High Drive, see [GPIO](#) chapter for more details.

¹⁶ High baud rates may require GPIOs to be set as High Drive, see [GPIO](#) chapter for more details.

11.27 USBHS Electrical specification

11.27.1 USBHS Electrical specification

Symbol	Description	Min.	Typ.	Max.	Units
VBUS	VBUS USB supply voltage.	3.67		5.5	V
V _{D+D-}	Voltage on D+ and D- lines.	VSS - 0.3		VDECUSB + 0.3	V

11.28 WDT Electrical specification

11.28.1 Watchdog Timer Electrical Specification

Symbol	Description	Min.	Typ.	Max.	Units
t _{WDT}	Time out interval	458 μ s		36 h	

12 Recommended operating conditions

The operating conditions are the physical parameters that the device can operate within.

Symbol	Parameter	Min.	Nom.	Max.	Units
VDD	VDD supply voltage	1.7		3.6	V
VBUS	VBUS powers the USB physical interface	3.67	5.0	5.5	V
TA	Operating temperature	-40	25	85	°C
T _{RST}	Recommended storage temperature			40	°C
RH _{RST}	Recommended storage relative humidity			90	%

Table 91: Recommended operating conditions

Note: VDD supply is required for device operation. VBUS is optional and is only used to supply the USB physical interface when the USB interface is in use. VBUS cannot be used to power the device.

12.1 Light sensitivity

Some package types are sensitive to visible and close-range infrared light. For those packages, the final product design must shield the device properly, either by encapsulation or by shielding or coating of the package. Other package types are not light sensitive and do not require such protection.

Of the package options for the nRF54LM20A and nRF54LM20B devices, only the wafer-level CSP (WLCSP) package is light sensitive. WLCSP packages have a backside coating, where the marking side of the device is covered with a light absorbing film, but the side edges and the ball side remain exposed and must be protected in the final product by encapsulation or shielding/coating of the CSP device.

Flip-chip CSP (FCCSP) packages and Quad Flat No-lead (QFN) packages are not light sensitive.

Package	Package type	Light sensitive
CSP61 (CAAA)	Wafer-level CSP (WLCSP)	Yes
CSP98 (PAAA)	Flip-chip CSP (FCCSP)	No
QFN52 (QGAA)	Quad flat no-lead (QFN)	No

Table 92: Package light sensitivity

13 Absolute maximum ratings

Maximum ratings are the extreme limits to which the chip can be exposed for a limited amount of time without permanently damaging it. Exposure to absolute maximum ratings for prolonged periods of time may affect the reliability of the device.

For accelerated lifetime testing (HTOL, etc.), supply voltage should not exceed the recommended operating conditions max value, see [Recommended operating conditions](#) on page 1283.

	Parameter	Min.	Max.	Unit
VDD	VDD supply voltage	-0.3	3.9	V
VBUS	VBUS voltage for the USB physical interface	-0.3	6.0	V

Table 93: Supply voltage

	Parameter	Min.	Max.	Unit
$V_{I/O}, VDD \leq 3.6 \text{ V}$	IO voltage	-0.3	$VDD + 0.3$	V
$V_{I/O}, VDD > 3.6 \text{ V}$	IO voltage	-0.3	3.9	V

Table 94: I/O pin voltage

	Min.	Max.	Unit
RF input level		10	dBm

Table 95: Radio

	Note	Min.	Max.	Unit
Storage temperature		-40	+125	°C
Reflow soldering temperature	Reflow cycle time is 30 seconds with 3 maximum reflow cycles.		260	°C
Moisture Sensitivity Level (MSL)			2	
ESD Human Body Model (HBM)			1	kV
ESD Charged Device Model (CDM)			500	V

Table 96: Environmental QFN package types

	Note	Min.	Max.	Unit
Storage temperature	Recommended storage condition is < 40°C and < 90% RH (relative humidity)	-40	+125	°C
Reflow soldering temperature	Reflow cycle time is 30 seconds with 3 maximum reflow cycles.		260	°C
Moisture Sensitivity Level (MSL)			1	
ESD Human Body Model (HBM)			2	kV
ESD Charged Device Model (CDM)			250	V

Table 97: Environmental CSP package types

	Note	Min.	Max.	Unit
Storage temperature	Recommended storage condition is < 40°C and < 90% RH (relative humidity)	-40	+125	°C
Reflow soldering temperature	Reflow cycle time is 30 seconds with 3 maximum reflow cycles.		260	°C
Moisture Sensitivity Level (MSL)			3	
ESD Human Body Model (HBM)			2	kV
ESD Charged Device Model (CDM)			250	V

Table 98: Environmental FCCSP package types

	Min.	Max.	Unit
Endurance	10,000		Write/ rewrite cycles
Retention at 85°C	10		y

Table 99: RRAM memory

14 Ordering information

This chapter contains information on device marking, ordering codes, and container sizes.

14.1 Device marking

The package is marked as shown in the following figure.

N	5	4	L	<D	D	D	D>
<P	P>	<V	V>	<H>	<P>

14.2 Order code

The following are the order codes and definitions for the device.

n	R	F	5	4	L	<D	D	D	D>	-	<P	P>	<V	V>	-	<C	C>
---	---	---	---	---	---	----	---	---	----	---	----	----	----	----	---	----	----

Figure 220: Order code

Abbreviation	Definition and implemented codes
N54L/nRF54L	nRF54L series product
<DDDD>	Device code
<PP>	Package variant code
<VV>	Function variant code
<H><P><F>	Build code H - Hardware version code P - Production configuration code (production site, etc.) F - Firmware version code (only visible on shipping container label)
<YY><WW><LL>	Tracking code YY - Year code WW - Assembly week number LL - Wafer lot code
<CC>	Container code

14.4 Product options

Defined here are the product options for the device.

The following table lists the ordering code, as well as the minimum ordering quantity (MOQ).

Order code	MOQ
nRF54LM20A-CAAA-R7	1500
nRF54LM20A-CAAA-R	7000
nRF54LM20A-PAAA-R7	1500
nRF54LM20A-PAAA-R	6000
nRF54LM20A-QGAA-R7	1000
nRF54LM20A-QGAA-R	3000

Table 111: nRF54LM20A order codes

Order code	MOQ
nRF54LM20B-CAAA-R7	1500
nRF54LM20B-CAAA-R	7000
nRF54LM20B-PAAA-R7	1500
nRF54LM20B-PAAA-R	6000
nRF54LM20B-QGAA-R7	1000
nRF54LM20B-QGAA-R	3000

Table 112: nRF54LM20B order codes

Order code	Description
nRF54LM20-DK	nRF54LM20 Development Kit

Table 113: Development tools order code

14.5 Preprogrammed firmware

The device is preprogrammed with firmware to allow debug access over the serial wire debug (SWD) interface.

The preprogrammed firmware disables access port protection by writing the TAMPC.PROTECT registers, and thus ensures the device can be programmed using the SWD interface without an Erase all function.

For more information about debug access protection, see [Access port protection](#) on page 1176.

15 Legal notices

By using this documentation you agree to our terms and conditions of use. Nordic Semiconductor may change these terms and conditions at any time without notice.

Liability disclaimer

Nordic Semiconductor ASA reserves the right to make changes without further notice to the product to improve reliability, function, or design. Nordic Semiconductor ASA does not assume any liability arising out of the application or use of any product or circuits described herein.

Nordic Semiconductor ASA does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. If there are any discrepancies, ambiguities or conflicts in Nordic Semiconductor's documentation, the Datasheet prevails.

Nordic Semiconductor ASA reserves the right to make corrections, enhancements, and other changes to this document without notice.

Customer represents that, with respect to its applications, it has all the necessary expertise to create and implement safeguards that anticipate dangerous consequences of failures, monitor failures and their consequences, and lessen the likelihood of failures that might cause harm, and to take appropriate remedial actions.

Nordic Semiconductor ASA assumes no liability for applications assistance or the design of customers' products. Customers are solely responsible for the design, validation, and testing of its applications as well as for compliance with all legal, regulatory, and safety-related requirements concerning its applications.

Nordic Semiconductor ASA's products are not designed for use in life-critical medical equipment, support appliances, devices, or systems where malfunction of Nordic Semiconductor ASA's products can reasonably be expected to result in personal injury. Customer may not use any Nordic Semiconductor ASA's products in life-critical medical equipment unless adequate design and operating safeguards by customer's authorized officers have been made. Customer agrees that prior to using or distributing any life-critical medical equipment that include Nordic Semiconductor ASA's products, customer will thoroughly test such systems and the functionality of such products as used in such systems.

Customer will fully indemnify Nordic Semiconductor ASA and its representatives against any damages, costs, losses, and/or liabilities arising out of customer's non-compliance with this section.

RoHS and REACH statement

Refer to for complete hazardous substance reports, material composition reports, and latest version of Nordic's RoHS and REACH statements.

11.5 COMP Electrical specification.	1258
11.5.1 COMP Electrical Specification.	1258
11.6 CPU Electrical specification.	1258
11.6.1 CPU performance.	1258
11.6.2 CPU wakeup times.	1259
11.7 GPIO Electrical specification.	1259
11.7.1 GPIO Electrical Specification.	1259
11.8 LPCOMP Electrical specification.	1260
11.8.1 LPCOMP Electrical Specification.	1260
11.9 NFCT Electrical specification.	1260
11.9.1 NFCT Electrical Specification.	1260
11.9.2 NFCT Timing Parameters.	1260
11.10 OSCILLATORS Electrical specification.	1261
11.10.1 32 MHz crystal oscillator (HFXO).	1261
11.10.2 32.768 kHz crystal oscillator (LFXO).	1261
11.11 PPI Electrical specification.	1262
11.11.1 Typical PPI latencies.	1262
11.12 PDM Electrical specification.	1262
11.12.1 PDM Electrical Specification.	1262
11.13 QDEC Electrical specification.	1263
11.13.1 QDEC Electrical Specification.	1263
11.14 RADIO Electrical specification.	1263
11.14.1 General radio characteristics.	1263
11.14.2 Radio current consumption (transmitter).	1263
11.14.3 Radio current consumption (Receiver).	1264
11.14.4 Transmitter specification.	1264
11.14.5 Receiver operation.	1265
11.14.6 RX selectivity.	1266
11.14.7 RX intermodulation.	1267
11.14.8 Radio timing.	1267
11.14.9 Received signal strength indicator (RSSI) specifications.	1268
11.14.10 Jitter.	1269
11.14.11 IEEE 802.15.4 mode energy detection constants.	1269
11.15 REGULATORS Electrical specification.	1269
11.15.1 Recommended operating conditions.	1269
11.15.2 Power-fail comparator.	1270
11.16 RESET Electrical specification.	1270

11.16.1 Startup times.	1270
11.17 RRAMC Electrical specification.	1270
11.17.1 RRAM programming.	1270
11.18 SAADC Electrical specification.	1270
11.18.1 SAADC Electrical Specification.	1270
11.19 SPIM Electrical specification.	1271
11.19.1 Timing specifications.	1271
11.19.2 Timing specifications for GPIO port P0 using Standard drive strength.	1272
11.19.3 Timing specifications for GPIO port P0 using High drive strength.	1272
11.19.4 Timing specifications for GPIO port P1 using Standard drive strength.	1273
11.19.5 Timing specifications for GPIO port P1 using High drive strength.	1273
11.19.6 Timing specifications for GPIO port P2 using Standard drive strength.	1273
11.19.7 Timing specifications for GPIO port P2 using High drive strength.	1273
11.19.8 Timing specifications for GPIO port P2 using Extra high drive strength.	1273
11.19.9 Timing specifications for GPIO port P3 using Standard drive strength.	1274
11.19.10 Timing specifications for GPIO port P3 using High drive strength.	1274
11.20 SPIS Electrical specification.	1274
11.20.1 SPIS slave interface electrical specifications.	1274
11.20.2 Serial Peripheral Interface Slave (SPIS) timing specifications.	1274
11.20.3 Timing specifications for GPIO port P0 using Standard drive strength.	1276
11.20.4 Timing specifications for GPIO port P0 using High drive strength.	1276
11.20.5 Timing specifications for GPIO port P1 using Standard drive strength.	1276
11.20.6 Timing specifications for GPIO port P1 using High drive strength.	1277
11.20.7 Timing specifications for GPIO port P2 using Standard drive strength.	1277
11.20.8 Timing specifications for GPIO port P2 using High drive strength.	1277
11.20.9 Timing specifications for GPIO port P2 using Extra high drive strength.	1277
11.20.10 Timing specifications for GPIO port P3 using Standard drive strength.	1277
11.20.11 Timing specifications for GPIO port P3 using High drive strength.	1278
11.21 SWDP Electrical specification.	1278
11.21.1 SW-DP.	1278
11.21.2 Trace port.	1278
11.22 TEMP Electrical specification.	1279
11.22.1 Temperature Sensor Electrical Specification.	1279
11.23 TDM Electrical specification.	1279
11.23.1 TDM timing specification.	1279
11.23.2 Timing specifications for Slave mode.	1279
11.23.3 Timing specifications for Master mode.	1280
11.24 TWIM Electrical specification.	1280
11.24.1 TWIM interface electrical specifications.	1280
11.24.2 Two Wire Interface Master (TWIM) timing specifications.	1280
11.25 TWIS Electrical specification.	1281
11.25.1 TWIS slave timing specifications.	1281
11.26 UARTE Electrical specification.	1281
11.26.1 UARTE electrical specification.	1281
11.27 USBHS Electrical specification.	1282
11.27.1 USBHS Electrical specification.	1282
11.28 WDT Electrical specification.	1282
11.28.1 Watchdog Timer Electrical Specification.	1282

12 Recommended operating conditions. 1283

12.1 Light sensitivity.	1283
---------------------------------	------

13 Absolute maximum ratings. 1284

14 Ordering information. 1287

14.1 Device marking. 1287

14.2 Order code. 1287

14.3 Code ranges and values. 1288

14.4 Product options. 1289

14.5 Preprogrammed firmware. 1290
